

13

Social Indicators

This chapter provides indicators in the areas of demography, health, education, and gender issues in development. These indicators can be useful in evaluating and monitoring the social impact of development progress, aid flows, and structural adjustment policies.

The chapter presents such indicators as dependency ratio, urbanization, crude death rate, life expectancy at birth, infant mortality rate, child mortality rate, immunization rates for children, maternal death rate, and number of people per physician. These indicators are an indirect measure of the physical well-being of the population. In the same vein, such indicators as literacy rate among adults, school enrollment ratios by gender, and pupil-teacher ratio give some picture of the progress being made in education and training. Social indicators refer to phenomena that are inherently more qualitative than macroeconomic variables and thus need to be interpreted cautiously. Further caution is called for because of the particular limitations of the data. One of these limitations is the paucity—or even nonexistence—of data on certain indicators in many of the countries covered. This is especially true of indicators dealing with gender issues. Many countries have no data showing the gender breakdown of several social indicators.

Even when data are available, comparison among countries is limited because of varied practices in data gathering and reporting. Often the countries report survey data that cover different portions of the nation. Sometimes surveys are limited to only the urban areas—the largest cities—or the capital city alone. This is especially true of the health indicators. Such indicators as immunization rates for children age 12–23 months, percentage of births attended by health personnel, infant mortality rate, child mortality rate, and maternal death rate are often based on surveys of a handful of hospitals in the urban areas.

Another source of limitation is the definition of terms, which may differ from country to country. Some countries, for example, consider an institution as a “private school” only if it receives no form of financial support from the government, while others classify as “private” all schools not run by the government, whether or not they receive financial support from the government. In like manner, some countries include personnel other than doctors and trained nurses under “medical personnel.”

Cultural norms may also affect the reported data. This is especially true for gender issues. In some countries, it is assumed that no woman can be the head of any household that also contains an adult male. In population censuses, therefore, enumerators

and respondents simply take such assumptions for granted, reporting a male rather than a female as head of the household or family (see United Nations, *The World's Women: Trends and Statistics (1970–90)*). This distorts the true picture of the percentage of households headed by women.

The main source for this chapter is the *World Development Indicators* in the World Bank Statistical Information Management Analysis Database (SIMA), which contains electronic information as reported by a number of institutions and agencies in the socioeconomic field, such as the United Nations,

UNICEF, UNESCO, the World Health Organization (WHO), the UNDP, the Joint United Nations Programme on HIV/AIDS (UNAIDS), and the Economic Commission for Africa (ECA). Other sources of data also include reports and publications on children, health, human development, education, and population from various agencies, including the World Bank.

In this chapter, columns headed by a period (for example, 1994–2002) show data for the latest available year within the period.

Technical notes

Tables

Table 13-1. Age and gender structure of the population. Age and gender structure of the population (UN and World Bank data) is the distribution of the total population according to age and gender. Only the female composition of the population is presented, as the male composition can easily be figured as the residual. Figures relate to midyear populations as estimated from the latest censuses. Age dependency ratio is calculated as the ratio of dependents—population under age 15 and above age 65—to the working age population—those aged 15 to 64.

Table 13-2. Poverty. This table presents selected indicators for comparing the incidence and extent of urban and rural poverty. The first two indicators use purchasing power parities rather than official exchange rates to calculate GDP per capita and population living under US\$1.08 a day: a measure of the overall mean level of poverty at the national level. The next indicator is the national poverty head count, which shows the percentage of the population living below the poverty line deemed appropriate for the country by its authorities. The poverty line is defined as the level below which adequate standards of nutrition, shelter, and personal amenities cannot be assured. Since these levels are country specific, cross-country comparisons cannot be made. The next indicator, however, uses a relative concept of poverty, which does allow such comparisons. It shows the percentage of the urban and rural populations living on less than two-thirds of the national mean per capita income. Associated with these indicators are the urban and rural Gini coefficients, which describe the level of inequality in urban and rural income distributions. The last indicator shows the percentage of household income spent on food (UNDP, World Bank, Penn World Tables, and National Household Surveys).

Table 13-3. Income distribution. These data present the share of income held by the richest and poorest population groups in a country (World Bank data and National Household Surveys).

Table 13-4. Urbanization. This table presents the number of persons living in urban areas as a percentage of the total population. Average annual percentage growth rates are shown separately for the urban population and the total population. The urban population percentages are based on the number of persons living in areas defined as “urban” according to national definitions of this concept. Since national definitions differ, cross-country comparisons should be made with caution (World Bank data).

Table 13-5. Components of population change. Three determinants of population change are presented here: total fertility rate, crude birth rate, and crude death rate. Crude birth rate is the number of births per 1,000 population in a given year. Crude death rate is the number of deaths per 1,000 population in a given year. Total fertility rate is the average number of children that would be born alive to a woman during her lifetime, if she were to bear children at each age in accordance with prevailing age-specific fertility rates (World Bank data).

Table 13-6. Survival prospects. This table shows four health-related indicators: life expectancy at birth, infant mortality rate, child mortality rate, and maternal mortality rate.

Life expectancy at birth is the number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout his or her life. Infant mortality rate is the number of deaths of infants under one year of age per 1,000 live births in a given year. Child mortality rate is the number of deaths of children under five years

of age per 1,000 live births in a given year. Maternal mortality rate is the annual number of deaths of women from pregnancy-related causes per 100,000 live births.

Table 13-7. HIV/AIDS estimates and data, end 2003.

Data reported on this table give the estimated number of people with HIV/AIDS. The data are broken into adults aged 15–49 years and children 0–14 years. Adult rate is the total estimated number of adults (men and women) living with HIV/AIDS divided by the adult population aged 15–49 years. Depending on the reliability of the data available, there may be more or less uncertainty surrounding each estimate. Therefore, plausible bounds have been presented for adult rate. Orphans are defined as children aged 0–17 years who have lost one or both parents to AIDS. AIDS deaths are estimated number of adults and children who died of AIDS.

Table 13-8. Immunization and ORT use. This is the percentage of children aged 12–23 months immunized against tuberculosis, DPT, polio, and measles. It also gives the use rate of oral rehydration therapy (ORT) among children under five years of age. DPT refers to diphtheria, pertussis (whooping cough), and tetanus. ORT use is the percentage of all cases of diarrhea in children under five years of age treated with oral rehydration salts or an appropriate household solution (WHO data).

Table 13-9. Child malnutrition. Data reported in this table give the percentage of children and babies suffering from the nutrition-related problems of having low birthweight and being underweight, or suffering from wasting and stunting. Figures are also given on the extent of breastfeeding among nursing mothers.

Low birthweight refers to babies born weighing less than 2,500 grams. *Underweight* refers to children under the age of five weighing two standard deviations below the median weight for age of the reference population. *Underweight* refers to children under five years weighing two standard deviations below the median weight for height of the reference population. *Wasting* refers to children of ages 12 through 23 months weighing two standard deviations

below the median weight for height of the reference population. *Stunting* refers to children of ages 24 through 59 months standing two standard deviations below the median height-for-age of the reference population (UNDP various years, WHO, and World Bank data).

Table 13-10. Access to sanitation facilities.

Table 13-10 shows the percentage of the population with access to sanitation facilities (WHO data). Urban areas with access to sanitation facilities are defined as urban populations served by connections to public sewers or household systems, such as pit privies, pour-flush latrines, septic tanks, communal toilets, and other such facilities. Rural populations with access were defined as those with adequate disposal, such as pit privies and pour-flush latrines. Application of these definitions may vary, and comparisons can therefore be misleading.

Table 13-11. Access to safe water. This table refers to the percentage of the population with reasonable access to a safe water supply, which includes treated surface waters or untreated but uncontaminated water, such as that from springs, sanitary wells, and protected boreholes. In an urban area, this may be a public fountain or standpost located not more than 200 meters away. In rural areas, it implies that members of the household do not have to spend a disproportionate part of the day fetching water. Data are presented separately for total, urban, and rural population (WHO data).

Table 13-12. Health expenditure. This table shows total health expenditure as percentage of GDP and on a per capita basis—both in U.S. dollars and PPP terms. The ratio to GDP is also shown for public and private expenditure. *Total expenditure* is the sum of public and private health expenditures. It covers the provision of health services (preventive and curative), family planning activities, nutrition activities, and emergency aid designated for health, but does not include provision of water and sanitation. *Public expenditure* consists of recurrent and capital spending from government (central and local) budgets, external borrowings and grants (including donations from international agencies and nongovernmental organizations,

and social (or compulsory) health insurance funds. *Private expenditure* includes direct household (out-of-pocket) spending, private insurance, charitable donations, and direct service payments by private corporations (WHO, IMF, and World Bank data).

Table 13-13. Health care. Indicators presented here are population per physician, population per hospital bed, the percentage of births attended by trained health personnel, and the percentage of population with access to health services. The figure for physicians includes, in addition to the total number of registered practitioners in the country, medical assistants whose medical training is less than that of qualified physicians, but who nevertheless dispense similar medical services, including simple surgical operations. The definition of recognized medical practitioners differs among countries. Hospital beds include inpatient beds available in public, private, general, and specialized hospitals and in rehabilitation centers. In most cases acute and chronic care are included. *Births attended* refers to births attended by physicians, nurses, midwives, trained primary health care workers, or trained traditional birth attendants. *Access to health services* refers to the percentage of the population that can reach appropriate local health services by local transport in no more than one hour (WHO and World Bank data).

Table 13-14. Literacy rate. This table shows the share of literate adults in the total adult population aged 15 years and over. Literacy is defined as the ability to read and write. A person who can, with understanding, both read and write a short, simple statement about his everyday life is literate. Persons who can read, but cannot write, are included with illiterates. Figures are shown separately for males, females, and both genders combined (UNESCO data).

Tables 13-15. Primary school gross enrollment ratio. This is the total number of pupils enrolled at the primary level of education, regardless of age, expressed as a percentage of the population corresponding to the official school age of primary education in a given country. Data are given separately for males, females, and both genders combined. Figures shown may be more than 100 percent since total enrollment

includes pupils above and pupils below the primary school age, as well as repeaters (UNESCO data).

Tables 13-16. Pupil progression. This table provides two education indicators. *Percentage of cohort reaching grade 5* shows the percentage of children starting primary school who eventually attain grade 4. The estimate is based on the Reconstructed Cohort Method, which uses data on enrollment and repeaters for two consecutive years. *Progression to secondary school (general)* is the number of new children in the first grade of secondary school (general) divided by the number of children enrolled in the final grade of primary school in the previous year, according to the country's duration of primary education (UNESCO and World Bank data).

Table 13-17. Net primary enrollment ratio. This is the ratio of the number of children of official school age enrolled in school to the number of children of official school age in the population (UNESCO data).

Table 13-18. Number of school teachers. Teachers in both public and private schools are covered in this table. Data refer to both full-time and part-time teachers, excluding other instructional personnel without teaching functions. Figures are shown here separately for primary and secondary schools. *Percentage females* means the number of female teachers expressed as a percentage of total teaching staff (UNESCO data).

Table 13-19. Pupil/teacher ratio. This ratio gives the average number of pupils per teacher. Figures are given separately for primary and secondary schools. As teaching staff includes both full-time and part-time teachers, comparability of this ratio between countries may be affected because the proportion of part-time teachers varies greatly from one country to another (UNESCO data).

Table 13-20. Secondary school gross enrollment ratio. This is the secondary school equivalent of the data presented in Table 13-15. It gives the total number of students enrolled at the secondary level of education, regardless of age, expressed as a percentage of the population corresponding to the official school

age of secondary education. Data are presented separately for males, females, and both genders combined. *Secondary general education* refers to education in secondary schools that provides general or specialized instruction based upon at least four years of previous instruction at the first or primary level, but that does not specifically aim at preparing the pupils directly for a given trade or occupation. Such schools may be called high schools, middle schools, or lyceums and offer courses of study whose completion is a minimum condition for admission into universities. In some countries, some of these schools provide both academic and vocational training. These composite secondary schools are considered as equivalent to the academic type of secondary school and are thus classified as secondary *general* (UNESCO data).

Table 13-21. Public expenditure on education. This table presents public expenditure on education (UNESCO) first as a percentage of total public expenditure (IMF/GFS) and then as a percentage of current GDP (Table 2-5).

Table 13-22. Economic opportunities of women. This table shows two indicators. *Female/male ratio of participation in economic activity* shows the number of female workers in relation to the number of male

workers. *Female as percentage of male in occupational group* shows the breakdown of the first indicator for occupational categories (UNDP data).

Table 13-23. Household and economic participation of women. This table presents indicators on gender issues in development. *Households headed by women* (World Bank data) refers to families in which a woman is acknowledged as the head by the other members. The occupational statistics are based on the UN's *Statistical Yearbook*.

Figures

The following indicators have been used to derive the figures in this chapter.

Figure 13-1. Life expectancy, 2003 (Table 13-6).

Figure 13-2. GDP per capita, based on PPP, 2003 (Table 13-2).

Figure 13-3. Urban population as a percentage of total population, 2003 (Table 13-4).

Figure 13-4. Primary school gross enrollment ratio, 2002 (Table 13-15).

Figure 13-5. Maternal mortality, 1999 (Table 13-6).

Methodology used for regional aggregations and period averages in chapter 13

Table	Aggregations ^a					Period averages ^b	
	(1)	(2)	(6)	(7)	(8)	(1)	(2)
13-1		x					
Columns 1-8		x					
Columns 9-10			x				
13-2			x				
Columns 1, 3		x					
Columns 4, 5, 8				x			
Columns 2, 6-7					x		
13-3					x		
13-4						x	
Columns 1-3	x						
Columns 4-6						x	
Columns 7-9			x				
Columns 10-12						x	
13-5			x				
Columns 1-3			x				
Columns 4-6	x

13-23					x		

Note: Regional aggregations are shown in the rows for Sub-Saharan Africa, North Africa, and All Africa. Period averages are shown in the last three columns. This table shows only the methodologies used in this chapter.

a. Regional aggregations: (1) simple total; (2) simple total of the first indicator divided by the simple total of the second indicator (same country coverage); (3) simple total of the gap-filled indicator; (4) simple total of the gap-filled main indicator divided by the simple total of the gap-filled secondary indicator; (5) simple total of the first gap-filled main indicator less the simple total of the second gap-filled main indicator, all divided by the simple total of the secondary indicator; (6) weighted total (by population); (7) median; (8) no aggregation; (9) simple arithmetic mean.

b. Period averages: (1) arithmetic mean (using the same series as shown in the table; i.e., ratio if the rest of the table is shown as ratio, level if the rest of the table is shown as level, growth rate if the rest is shown as growth rate); (2) least-squares growth rate (using main indicator); (3) least-squares growth rate (using main indicator in constant terms, with the rest of the table in current terms).
