a. Data refer to any year from 1980 to 1998, unless otherwise noted. b. Unless otherwise noted, sectoral withdrawal shares are estimated for 1987. c. Data refer to the most recent year available in the period. d. Total water resources include river flows from other countries. e. Data refer to years other than 1987 (see *Primary data documentation*). f. Data refer to estimates for years before 1980 (see *Primary data documentation*).

## Freshwater 3.5

### About the data

The data on freshwater resources are based on estimates of runoff into rivers and recharge of groundwater. These estimates are based on different sources and refer to different years, so cross-country comparisons should be made with caution. Because they are collected intermittently, the data may hide significant variations in total renewable water resources from one year to the next. The data also fail to distinguish between seasonal and geographic variations in water availability within countries. Data for small countries and countries in arid and semiarid zones are less reliable than those for larger countries and countries with higher rainfall. Finally, caution is also needed in comparing data on annual freshwater withdrawals, which are subject to variations in collection and estimation methods.

This year's edition of the *World Development Indicators* and last year's define freshwater resources as including river flows arising outside the country. The data in these editions therefore are not comparable with those published in previous years, which exclude external sources. Because the definition includes river flows entering a country but does not deduct river flows out of countries, it double counts the availability of water from international river ways. This can be important in water-short countries, notably in the Middle East.

Access to safe water measures the share of the population served by improved sources of water. An improved source can be any form of collection or piping used to make water regularly available. While information on access to safe water is widely used, it is extremely subjective, and such terms as *safe* and *adequate amount* may have very different meanings in different countries despite official World Health Organization (WHO) definitions (see *Definitions* for table 2.15). Even in high-income countries treated water may not always be safe to drink. While access to safe water is equated with connection to a public supply system, this does not take account of variations in the quality and cost (broadly defined) of the service once connected. Thus cross-country comparisons must be made cautiously. Changes over time within countries may result from changes in definitions or measurements.

### Definitions

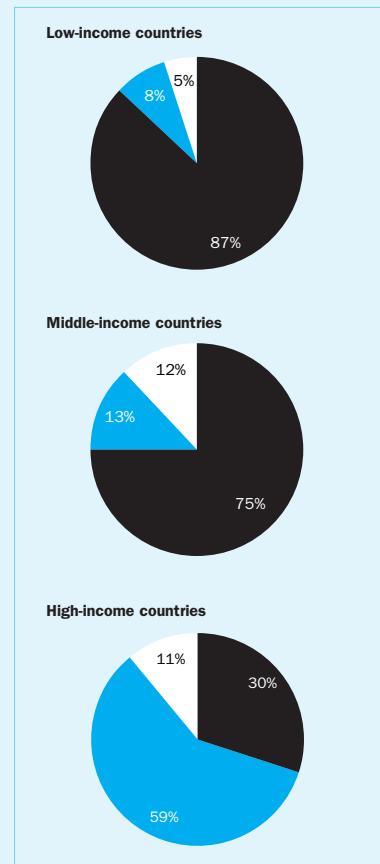

- **Freshwater resources** refer to total renewable resources, which include flows of rivers and groundwater from rainfall in the country, and river flows from other countries. Freshwater resources per capita are calculated using the World Bank's population estimates (see table 2.1).
- **Annual freshwater withdrawals** refer to total water withdrawal, not counting evaporation losses from storage basins. Withdrawals also include water from desalination plants in countries where they are a significant source. Withdrawal data are for single years between 1980 and 1998 unless otherwise indicated. Withdrawals can exceed 100 percent of total renewable resources where extraction from nonrenewable aquifers or desalination plants is considerable or where there is significant water reuse.
- **Access to safe water** refers to the percentage of people with reasonable access to an adequate amount of safe water in a dwelling or within a convenient distance of their dwelling (see *About the data*).

### Data sources

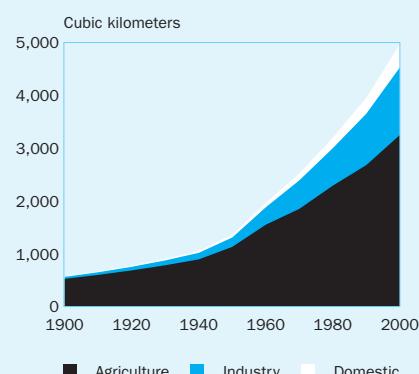

The data on freshwater resources and withdrawals are compiled by the World Resources Institute from various sources and published in *World Resources 1998–99* and *World Resources 2000–01* (produced in collaboration with the United Nations Environment Programme, United Nations Development Programme, and World Bank). The data on access to safe water come from the WHO.
