**T**

## he world economy expands and economies grow closer

Economic integration is the widening and deepening of the ties that link national economies. Trade, finance, movement of people, and transportation and communication infrastructure are the mechanisms. But integration is not a simple or certain process. Political and cultural connections underpin economic alliances. Geography may pose obstacles to integration, while technology can overcome them.

The past two decades have seen an enormous increase in the size of the global economy and of the economic ties between countries. Between 1990 and 2006 East Asia and Pacific's trade increased from 47 percent of its gross domestic product (GDP) to 87 percent, and gross private capital flows from international sources increased from 7 percent of GDP to 11 percent. In Sub-Saharan Africa trade within the region and with the rest of the world increased from 52 percent of GDP to 72 percent, and gross private capital flows rose from 12 percent to 14 percent. Evidence of integration? Yes, but the two regions have had much different experiences. Each had about 3.5 percent of global exports in 1980, but by 2006 East Asia and Pacific's share had grown to 10.8 percent while Sub-Saharan Africa's had fallen to 1.9 percent.

As global integration proceeds, developing countries are likely to expand their share of the global economy, especially regional centers with large populations and a significant economic base, such as Brazil, China, India, the Russian Federation, and South Africa. But even small and remote economies can take part. Better air and ocean transport gets products to markets faster and with more precise timing. Better transportation has been complemented by improvements in technology and favorable regulatory environments, reducing the costs of global communication, information dissemination, and management of economic activities. But as Dollar (2005, p. 148) notes, "As in previous waves of integration . . . change is driven partly by technological advances in transport and communications and partly by deliberate policy choices." Integration does not happen automatically.

All developing countries have the potential to gain from an integrated global environment. Like all economic forces, global integration may produce winners and losers. To realize the benefits of integration, countries need the capacity to absorb new technologies, use capital productively, and increase their labor force's knowledge and skills. Countries do not start with the same endowments—and wars, political divisions, and plain bad luck may blight their opportunities. The challenge is to ensure sustainable and widely shared growth.

Monitoring the development of global links provides the underpinning for policies aimed at managing challenges and aiding integration that is inclusive for all. The data in this section provide a snapshot of the world's integration and a framework for measuring it.

## Developing countries' growing world trade

International trade is a critical channel for integration. It increases economic efficiency and brings producers and consumers together. Developing countries' share in world trade has been rising from 16 percent in 1990 to 30 percent in 2006, led by China, whose exports now rival those of the United States, and with Brazil and India not far behind (figure 6a). Projections of further increases in developing countries' share, to 45 percent by 2030 (*Global Economic Prospects 2007*), reflect increasing integration.

Developing country trade integration, measured by the share of imports plus exports in GDP, has been rising rapidly, increasing from 40 percent of GDP in 1990 to almost 67 percent in 2006, surpassing the share in high-income economies. Developing country exports are changing as well. The share of manufactured goods in exports is large and rising while that of food and commodities (excluding fuels) is small and falling (figure 6b). And despite the attention given to the spread of offshore services, trade in goods remains many times greater than trade in services. India is a notable exception: its service sector now produces almost 40 percent of its exports.

## Financial integration: resilient and unabated

More access to international capital markets and foreign direct investment (FDI) has helped developing countries surmount their less developed capital markets. Developing countries have decreased their vulnerability to financial crises by reducing their external debt burden from 39 percent of gross national income in 1995 to 26 percent in 2006 and increasing foreign exchange reserves to 92 percent of long-term debt and 423 percent of more volatile, short-term debt in 2006 (figure 6c).

Private capital flows to developing countries increased more than 10-fold between 1990 and 2006. In 2006 developing countries received almost one-third of global FDI, though just over one-tenth of that went to low-income economies. Sub-Saharan Africa's 34 low-income economies received only 1 percent. The main source of external financing for low-income countries remains official development assistance (ODA). ODA, however, includes debt relief, technical assistance, and emergency relief, which do not provide the long-term investment needed to raise productive capacity. In constant prices ODA has risen more than 50 percent since 2000, but excluding debt, technical assistance, and emergency relief, it has risen only 25 percent (figure 6d).

**Rising reserves and falling debt make developing countries less vulnerable to crises**

## Movement of people facilitates common economic and social goals

Movement of people as tourists, migrants, or business travelers raises awareness and spreads knowledge, important elements of globalization. These movements link diverse populations with common economic and social goals. Global tourism increased 5.6 percent in 2006, a pace well above its long-term average. Tourist departures from developing economies have risen 43 percent since 2000, and 7 of the top 15 tourist destinations are in developing economies.

Migration increased sharply over the past two decades. Like other elements of globalization, migration patterns are shaped by market forces and official policies. Opportunities in high-income economies are a strong lure (figure 6e), and a need for workers has led many countries to relax entry barriers. Successful migration requires resources, skills, and adaptation to a new culture. So, the largest net flows of migrants are from middle-income economies.

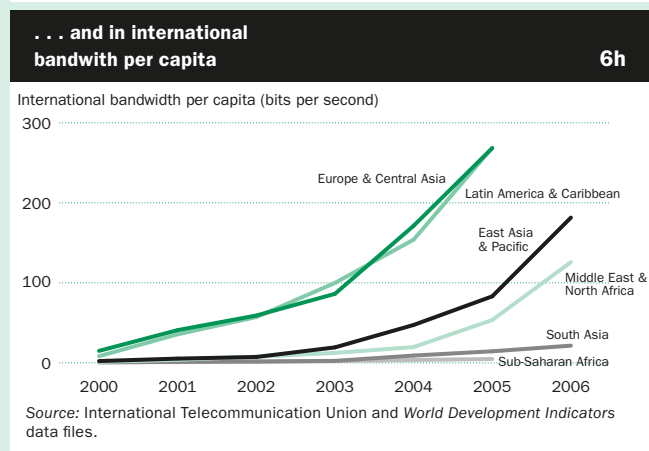

Migration facilitates cross-border remittances, a major source of foreign earnings for many developing countries. Remittances to developing countries almost quadrupled between 1995 and 2006, to more than \$220 billion (figure 6f), rivaling other forms of private financing.

## The role of information and communication technologies is expanding

Communication and information networks are crucial for overcoming geographic barriers, bringing people and markets closer. These networks enable effective management of enterprises across borders and participation in global production and service supply chains. Deregulation and competition have reduced communication costs. The average cost of a three-minute call to the United States fell from \$4.00 in 1999 to \$1.40 in 2004.

Over that period the share of people with access to the Internet tripled. The Internet promises to be an even greater force for globalization and development. But diffusion of technology around the world and within countries is unequal (figures 6g and 6h). Average contracted capacity for international Internet connections in developing economies grew from 3 bits per second per person in 2000 to 140 in 2006, still far short of the estimated 5,000 high-income average. Low-income economies' Internet capacity was still less than 20 bits per second per person in 2006, and international voice traffic less than 5 percent of the high-income average. Capital, policies, and infrastructure are needed to develop, adapt, and diffuse communication networks to accelerate development.

a. Data are from the International Telecommunication Union's (ITU) World Telecommunication Development Report database. Please cite the ITU for third-party use of these data.

b. Arrivals in hotels only. c. World Bank estimates. d. Refers to arrivals of nonresident visitors at national borders. e. Includes nationals residing abroad. f. Arrivals by air only. g. Arrivals in all types of accommodation establishments. h. Arrivals in hotels and similar establishments. i. Excludes nationals residing abroad. j. Includes Montenegro. k. World totals computed by the United Nations sum to zero, but because the aggregates shown here refer to World Bank definitions, regional and income group totals do not equal zero.

## About the data

Globalization—the integration of the world economy—has been a persistent theme of the past quarter century. Growth of cross-border economic activity has changed the structure of economies and the political and social organization of countries. Not all effects of globalization can be measured directly. But the scope and pace of change can be monitored along four key dimensions: trade in goods and services, financial flows, movement of people, and communication. Globalization has created opportunities and challenges for developing countries, but many poor people and countries have been unable to take full advantage of globalization's opportunities and benefits.

Trade data are based on gross flows that capture the two-way flow of goods and services. In conventional balance of payments accounting exports are recorded as a credit and imports as a debit. See tables 4.4 and 4.5 for data on the main trade components of merchandise trade and tables 4.6 and 4.7 for data on the main trade components of services trade.

Financing through international capital markets includes gross bond issuance, bank lending, and new equity placement as reported by Dealogic, a company specializing in the investment banking industry. In financial accounting inward investment is a credit and outward investment a debit. Gross flow is a better measure of integration than net flow because gross flow shows the total value of financial transactions over a given period, while net flow is the sum of credits and debits and represents a balance in which many transactions are canceled out.

Components of financing through international capital markets are reported in U.S. dollars by market sources.

Foreign direct investment (FDI) has three components: equity investment, reinvested earnings, and short- and long-term loans between parent firms and

foreign affiliates. Distinguished from other kinds of international investment, FDI is made to establish a lasting interest in or effective management control over an enterprise in another country. FDI may be understated in many developing countries because some countries fail to report reinvested earnings and because the definition of long-term loans differs across countries. However, the quality and coverage of the data are improving as a result of continuous efforts by international and national statistics agencies. See *About the data* for table 6.10 for more information.

Workers' remittances comprise workers' remittances, compensation of employees, and migrants' transfers. Migration and tourism have increased in importance over time, now accounting for a substantial part of global integration. See *About the data* and *Definitions* for tables 6.16 and 6.17 for information on migration and tourism.

Well developed communications infrastructure attracts investments and allows investors to capitalize on benefits offered by the digital age. See *About the data* for tables 5.10 and 5.11 for more information.

## Definitions

- **Trade in merchandise** is the sum of merchandise exports and imports.
- **Trade in services** is the sum of services exports and imports.
- **Financing through international capital markets** is the sum of the absolute values of new bond issuance, syndicated bank lending, and new equity placements.
- **Foreign direct investment net inflows** are net inflows of investment in the reporting economy. FDI is the sum of equity capital, reinvestment of earnings, and other short- and long-term capital.
- **Foreign direct investment net outflows** are net outflows of investment from the reporting economy to the rest of the world.
- **Workers' remittances and compensation of employees**

**received** are current transfers by migrant workers and wages and salaries earned by nonresident workers. Workers' remittances are current private transfers from migrant workers resident in the host country for more than a year, irrespective of their immigration status, to recipients in their country of origin. Compensation of employees is the income of migrants who have lived in the host country for less than a year.

- **Net migration** is the total number of immigrants minus the total number of emigrants, including citizens and noncitizens, for the five-year period.
- **International inbound tourists** (overnight visitors) are the number of tourists who travel to a country other than that in which they have their usual residence, but outside their usual environment, for less than 12 months whose main purpose in visiting is not for paid work. When data on the number of tourists are not available, the number of day visitors, which includes tourists, cruise passengers, and crew members, is shown instead.
- **International outbound tourists** are the number of departures that people make from their country of usual residence to any other country for any purpose other than paid work.
- **Cost of call to U.S.** is the cost of a three-minute, peak rate, fixed-line call from the country to the United States.
- **International voice traffic** is the sum of international incoming and outgoing telephone traffic (in minutes) divided by total population.
- **International Internet bandwidth** is the contracted capacity of international connections between countries for transmitting Internet traffic.

## Data sources

Data on merchandise trade are from the World Trade Organization's (WTO) *Annual Report*. Data on trade in services are from the International Monetary Fund's (IMF) Balance of Payments database. Data on international capital market financing are based on data reported by Dealogic. Data on FDI are based on balance of payments data reported by the IMF, supplemented by staff estimates using data reported by the United Nations Conference on Trade and Development and official national sources. Data on workers' remittances are World Bank staff estimates based on IMF balance of payments data. Data on net migration are from the United Nations Population Division's *World Population Prospects: The 2006 Revision*. Data on international tourism are from the WTO's *Yearbook of Tourism Statistics and Compendium of Tourism Statistics 2008* and electronic updates. Data on cost of call to U.S., international voice traffic, and international Internet bandwidth are from the International Telecommunication Union's *International Development Report* database.

## Trade and international finance are leading globalization

6.1a

Trade in low- and middle-income economies has grown faster than trade in high-income economies since 2000. FDI net inflows in low-income economies soared in 2006.

a. Data are from the International Monetary Fund's International Financial Statistics database.

**About the data**

Data on international trade in goods are available from each country's balance of payments and customs records. While the balance of payments focuses on the financial transactions that accompany trade, customs data record the direction of trade and the physical quantities and value of goods entering or leaving the customs area. Customs data may differ from data recorded in the balance of payments because of differences in valuation and time of recording. The 1993 System of National Accounts and the fifth edition of the International Monetary Fund's (IMF) *Balance of Payments Manual* (1993) attempted to reconcile definitions and reporting standards for international trade statistics, but differences in sources, timing, and national practices limit comparability. Real growth rates derived from trade volume indexes and terms of trade based on unit price indexes may therefore differ from those derived from national accounts aggregates.

Trade in goods, or merchandise trade, includes all goods that add to or subtract from an economy's material resources. Trade data are collected on the basis of a country's customs area, which in most cases is the same as its geographic area. Goods provided as part of foreign aid are included, but goods destined for extraterritorial agencies (such as embassies) are not.

Collecting and tabulating trade statistics are difficult. Some developing countries lack the capacity to report timely data, especially landlocked countries and countries whose territorial boundaries are porous. Their trade has to be estimated from the data reported by their partners. (For further discussion of the use of partner country reports, see *About the data* for table 6.3.) Countries that belong to common customs unions may need to collect data through direct inquiry of companies. Economic or political concerns may lead some national authorities to suppress or misrepresent data on certain trade flows, such as oil, military equipment, or the exports of a dominant producer. In other cases reported trade data may be distorted by deliberate under- or over-invoicing to affect capital transfers or avoid taxes. And in some regions smuggling and black market trading result in unreported trade flows.

By international agreement customs data are reported to the United Nations Statistics Division, which maintains the Commodity Trade (Comtrade) and Monthly Bulletin of Statistics databases. The United Nations Conference on Trade and Development (UNCTAD) compiles international trade statistics, including price, value, and volume indexes,

from national and international sources such as the IMF's International Financial Statistics database, the United Nations Economic Commission for Latin America and the Caribbean, the United Nations Statistics Division's Monthly Bulletin of Statistics database, the World Bank Africa Database, the U.S. Bureau of Labor Statistics, Japan Customs, and UNCTAD's Commodity Price Statistics. The IMF also compiles data on trade prices and volumes in its International Financial Statistics (IFS) database.

Unless otherwise noted, the growth rates and terms of trade in the table were calculated from index numbers compiled by UNCTAD. The growth rates and terms of trade for selected economies were calculated from index numbers compiled in the IMF's *International Financial Statistics*. In some cases price and volume indexes from different sources vary significantly as a result of differences in estimation procedures. Because the IMF does not publish trade value indexes, for selected economies the trade value indexes were derived from the volume and price indexes. All indexes are rescaled to a 2000 base year.

The terms of trade measures the relative prices of a country's exports and imports. There are several ways to calculate it. The most common is the net barter (or commodity) terms of trade index, or the ratio of the export price index to the import price index. When a country's net barter terms of trade index increases, its exports become more valuable or its imports cheaper.

**Definitions**

• **Export and import volumes** are indexes of the quantity of goods traded. They are derived from UNCTAD's quantum index series and are the ratio of the export or import value indexes to the corresponding unit value indexes. Unit value indexes are based on data reported by countries that demonstrate consistency under UNCTAD quality controls, supplemented by UNCTAD's estimates using the previous year's trade values at the Standard International Trade Classification three-digit level as weights. For economies for which UNCTAD does not publish data, the export and import volume indexes (lines 72 and 73) in the IMF's *International Financial Statistics* are used to calculate the average annual growth rates. • **Export and import values** are the current value of exports (f.o.b.) or imports (c.i.f.), converted to U.S. dollars and expressed as a percentage of the average for the base period (2000). UNCTAD's export or import value indexes are reported for most economies. For selected economies for which UNCTAD does not publish data, the value indexes are derived from export or import volume indexes (lines 72 and 73) and corresponding unit value indexes of exports or imports (lines 74 and 75) in the IMF's *International Financial Statistics*. • **Net barter terms of trade index** is calculated as the percentage ratio of the export unit value indexes to the import unit value indexes, measured relative to the base year 2000.

**Data sources**

Data on trade indexes are from UNCTAD's annual *Handbook of Statistics* for most economies and from the IMF's *International Financial Statistics* for selected economies.

## Direction and growth of merchandise trade

### About the data

The table provides estimates of the flow of trade in goods between groups of economies. The data are from the International Monetary Fund's (IMF) Direction of Trade database. All developed and 23 developing countries report trade on a timely basis, covering about 80 percent of trade for recent years. Trade by less timely reporters and by countries that do not report is estimated using reports of trading partner countries. Because the largest exporting and importing countries are reliable reporters, a large portion of the missing trade flows can be estimated from partner reports. Partner country data may introduce discrepancies due to smuggling, confidentiality, different exchange rates, overreporting of transit trade, inclusion or exclusion of freight rates, and different points of valuation and times of recording.

In addition, estimates of trade within the European Union (EU) have been significantly affected by changes in reporting methods following the creation of a customs union. The current system for collecting data on trade between EU members—Intrastat, introduced in 1993—has less exhaustive coverage than the previous customs-based system and has resulted in some problems of asymmetry (estimated imports are about 5 percent less than exports). Despite these issues, only a small portion of world trade is estimated to be omitted from the IMF's *Direction of Trade Statistics Yearbook* and Direction of Trade database.

Most countries report their trade data in national currencies, which are converted into U.S. dollars

using the IMF's published period average exchange rate (series rf or rh, monthly averages of the market or official rates) for the reporting country or, if unavailable, monthly average rates in New York. Because imports are reported at cost, insurance, and freight (c.i.f.) valuations, and exports at free on board (f.o.b.) valuations, the IMF adjusts country reports of import values by dividing them by 1.10 to estimate equivalent export values. The accuracy of this approximation depends on the set of partners and the items traded. Other factors affecting the accuracy of trade data include lags in reporting, recording differences across countries, and whether the country reports trade according to the general or special system of trade. (For further discussion of the measurement of exports and imports, see *About the data* for tables 4.4 and 4.5.)

The regional trade flows in the table are calculated from current price values. The growth rates are in nominal terms; that is, they include the effects of changes in both volumes and prices.

### Definitions

- **Merchandise trade** includes all trade in goods; trade in services is excluded.
- **High-income economies** are those classified as such by the World Bank (see inside front cover).
- **European Union** is defined as all high-income EU members: Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Malta, the Netherlands, Portugal, Slovenia, Spain, Sweden, and the United Kingdom.
- **Other high-income economies** include all high-income economies (both Organisation for Economic Co-operation and Development members and others) except the high-income European Union, Japan, and the United States.
- **Low- and middle-income regional groupings** are based on World Bank classifications and may differ from those used by other organizations.

**More than half of the world's merchandise trade takes place between high-income economies. But integration of low- and middle-income economies in global merchandise trade increased substantially during 1996–2006**

6.3a

Trade between low- and middle-income economies accounted for about 8.3 percent of world merchandise trade in 2006, compared with 4.5 percent in 1996. The share of trade from low- and middle-income economies to high-income economies increased 7.3 percentage points between 1996 and 2006.

Source: International Monetary Fund's Direction of Trade database.

### Data sources

Data on the direction and growth of merchandise trade were calculated using the IMF's Direction of Trade database.

a. Tariff data are from the Trade Analysis and Information System (TRAINS) database and may have a different country coverage than that for the 20 EU members whose trade values are reported. b. Includes ad valorem equivalents of specific rates.

## About the data

Developing countries are becoming increasingly important in the global trading system. Since the early 1990s trade between high-income economies and low- and middle-income economies has grown faster than trade among high-income economies. The increased trade benefits consumers and producers. But as was apparent at the World Trade Organization's (WTO) Ministerial Conferences in Doha, Qatar, in October 2001, Cancun, Mexico, in September 2003, and Hong Kong, China, in December 2005, achieving a more pro-development outcome from trade remains a challenge. Meeting it will require strengthening international consultation. After the Doha meetings negotiations were launched on services, agriculture, manufactures, WTO rules, the environment, dispute settlement, intellectual property rights protection, and disciplines on regional integration. At the most recent negotiations in Hong Kong, China, trade ministers agreed to eliminate subsidies of agricultural exports by 2013; to abolish cotton export subsidies and grant unlimited export access to selected cotton-growing countries in Sub-Saharan Africa; to cut more domestic farm supports in the European Union, Japan, and the United States; and to offer more aid to developing countries to help them compete in global trade.

Trade flows between high-income and low- and middle-income economies reflect the changing mix of exports to and imports from developing economies. While food and primary commodities have continued to fall as a share of high-income economies' imports, manufactures as a share of goods imports from both

low- and middle-income economies have grown. And trade between developing economies has grown substantially over the past decade, a result of their increasing share of world output and liberalization of trade, among other influences.

Yet trade barriers remain high. The table includes information about tariff rates by selected product groups. Applied tariff rates are the tariffs in effect for partners in preferential trade agreements such as the North American Free Trade Agreement. When these rates are unavailable, most favored nation rates are used. The difference between most favored nation and applied rates can be substantial. Simple averages of applied rates are shown because they are generally a better indicator of tariff protection than weighted average rates are.

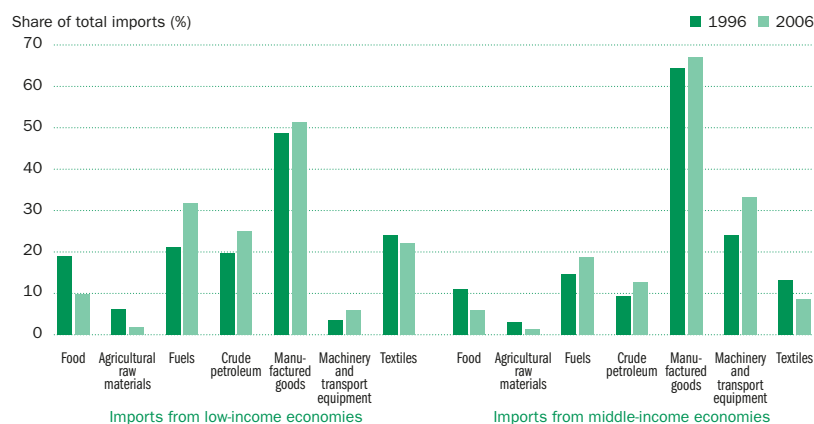

The data are from the United Nations Conference on Trade and Development (UNCTAD). Partner country reports by high-income economies were used for both exports and imports. Because of differences in sources of data, timing, and treatment of missing data, the numbers in the table may not be fully comparable with those used to calculate the direction of trade statistics in table 6.3 or the aggregate flows in tables 4.4, 4.5, and 6.2. Tariff line data were matched to Standard International Trade Classification (SITC) revision 1 codes to define commodity groups. For further discussion of merchandise trade statistics, see *About the data* for tables 4.4, 4.5, 6.2, and 6.3, and for information about tariff barriers, see table 6.7.

## Definitions

The product groups in the table are defined in accordance with the SITC revision 1: **food** (0, 1, 22, and 4) and **cereals** (04); **agricultural raw materials** (2 excluding 22, 27, and 28); **ores and nonferrous metals** (27, 28, and 68); **fuels** (3), **crude petroleum** (331), and **petroleum products** (332); **manufactured goods** (5–8 excluding 68), **chemical products** (5), **iron and steel** (67), **machinery and transport equipment** (7), **furniture** (82), **textiles** (65 and 84), **footwear** (85), and **other manufactured goods** (6 and 8 excluding 65, 67, 68, 82, 84, and 85); and **miscellaneous goods** (9). • **Exports** are all merchandise exports by high-income economies to low-income and middle-income economies as recorded in the United Nations Statistics Division's Comtrade database. Exports are recorded free on board (f.o.b.). • **Imports** are all merchandise imports by high-income economies from low-income and middle-income economies as recorded in the United Nations Statistics Division's Comtrade database. Imports include insurance and freight charges (c.i.f.). • **High-, middle-, and low-income economies** are those classified as such by the World Bank (see inside front cover). • **European Union** is defined as all high-income EU members: Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Malta, the Netherlands, Portugal, Slovenia, Spain, Sweden, and the United Kingdom.

## The composition of high-income economies' imports from low- and middle-income economies has changed over the last decade

6.4a

The shares of high-income economies' imports of food, agricultural raw materials, and textiles from low- and middle-income economies dropped noticeably between 1996 and 2006, while the shares of fuels (especially crude petroleum) and machinery and transport equipment have increased considerably.

Source: United Nations Statistics Division's Comtrade database.

## Data sources

Data on trade values are from United Nations Statistics Division's Comtrade database. Data on tariffs are from UNCTAD's Trade Analysis and Information System database and are calculated by World Bank staff using the World Integrated Trade Solution system.

#### About the data

Primary commodities—raw or partially processed materials that will be transformed into finished goods—are often the most significant exports of developing countries, and revenues obtained from them have an important effect on living standards. Price data for primary commodities are collected from a variety of sources, including trade journals, international study groups, government market surveys, newspaper and wire service reports, and commodity exchange spot and near-term forward prices.

The table is based on frequently updated price reports. When available, the prices received by exporters are used; otherwise, the prices paid by

importers are used. Annual price series are generally simple averages based on higher frequency data. The constant price series in the table is deflated using the manufactures unit value (MUV) index for the Group of Five (G-5) countries (see below).

The commodity price indexes are calculated as Laspeyres index numbers, in which the fixed weights are the 1987–89 export values for low- and middle-income economies rebased to 1990. Each index represents a fixed basket of primary commodity exports. The nonenergy commodity price index contains 37 price series for 31 nonenergy commodities.

Separate indexes are compiled for petroleum and steel products, which are not included in the nonenergy commodity price index.

The MUV index is a composite index of prices for manufactured exports from the five major (G-5) industrial economies (France, Germany, Japan, the United Kingdom, and the United States) to low- and middle-income economies, valued in U.S. dollars. The index covers products in groups 5–8 of the Standard International Trade Classification revision 1. To construct the MUV G-5 index, unit value indexes for each country are combined using weights determined by each country's export share.

a. Series not included in the nonenergy index.

## Definitions

• **Nonenergy commodity price index** covers the 31 nonenergy primary commodities that make up the agriculture, fertilizer, and metals and minerals indexes. • **Agriculture** includes beverages, food, and agricultural raw materials. • **Beverages** include cocoa, coffee, and tea. • **Food** includes rice, wheat, maize, sorghum, soybeans, soybean oil, soybean meal, palm oil, coconut oil, groundnut oil, bananas, beef, oranges, and sugar. • **Agricultural raw materials** include cotton, timber (logs and sawnwood), natural rubber, and tobacco. • **Fertilizers** include phosphate rock and triple superphosphate. • **Metals and minerals** include aluminum, copper, iron ore,

lead, nickel, tin, and zinc. • **Petroleum price index** refers to the average spot price of Brent, Dubai, and West Texas Intermediate crude oils, equally weighted.

• **Steel products price index** is the composite price index for eight steel products based on quotations free on board (f.o.b.) Japan excluding shipments to China and the United States, weighted by product shares of apparent combined consumption (volume of deliveries) for Germany, Japan, and the United States. • **MUV G-5 index** is the manufactures unit value index for G-5 country exports to low- and middle-income economies. • **Commodity prices**—for definitions and sources, see “Commodity price

data” (also known as the “Pink Sheet”) at the Global Prospects Web site ([www.worldbank.org/prospects](http://www.worldbank.org/prospects), click on Products).

## Data sources

Data on commodity prices and the MUV G-5 index are compiled by the World Bank’s Development Prospects Group. Monthly updates of commodity prices are available on the Web at [www.worldbank.org/prospects](http://www.worldbank.org/prospects).

a. FTA is free trade agreement, CU is customs union, EIA is economic integration agreement, PS is partial scope agreement, and NNA is not notified agreement, which refers to preferential trade arrangements established among member countries that are not notified to the World Trade Organization (these agreements may be functionally equivalent to any of the other agreements). b. No preferential trade agreement c. Members changed and new agreements entered into force in 2007, but are not reflected in the data shown. d. Years of the most recent agreement are collected from official trade bloc website. e. Free trade agreement was signed in 2006 but has not entered into force yet.

## About the data

Trade blocs are groups of countries that have established special preferential arrangements governing trade between members. Although in some cases the preferences—such as lower tariff duties or exemptions from quantitative restrictions—may be no greater than those available to other trading partners, such arrangements are intended to encourage exports by bloc members to one another—sometimes called intratrade.

Most countries are members of a regional trade bloc, and more than a third of the world's trade takes place within such arrangements. While trade blocs vary in structure, they all have the same objective: to reduce trade barriers between member countries. But effective integration requires more than reducing tariffs and quotas. Economic gains from competition and scale may not be achieved unless other barriers that divide markets and impede the free flow of goods, services, and investments are lifted. For example, many regional trade blocs retain contingent protections on intrabloc trade, including antidumping, countervailing duties, and “emergency protection” to address balance of payments problems or protect an industry from import surges. Other barriers include differing product standards, discrimination in public procurement, and cumbersome border formalities.

Membership in a regional trade bloc may reduce the frictional costs of trade, increase the credibility of reform initiatives, and strengthen security among partners. But making it work effectively is challenging. All economic sectors may be affected, and some may expand while others contract, so it is important to weigh the potential costs and benefits of membership.

The table shows the value of merchandise intratrade (service exports are excluded) for important regional trade blocs and the size of intratrade relative to each bloc's exports of goods and the share of the bloc's exports in world exports. Although the Asia Pacific Economic Cooperation (APEC) has no preferential arrangements, it is included because of the volume of trade between its members.

The data on country exports are from the International Monetary Fund's (IMF) Direction of Trade database and should be broadly consistent with those from sources such as the United Nations Statistics Division's Commodity Trade (Comtrade) database. However, trade flows between many developing countries, particularly in Sub-Saharan Africa, are not well recorded, so the value of intratrade for certain groups may be understated. Data on trade between developing and high-income countries are generally complete.

Membership in the trade blocs shown is based on the most recent information available (see *Data sources*). The table includes the date of each bloc's creation, the date of entry into force of the most recent preferential trade agreement, and the type of the agreement. Other types of preferential trade agreements may have entered into force earlier than those shown in the table and are still effective.

Under a free trade agreement members substantially eliminate all tariff and nontariff barriers but set tariffs on imports from nonmembers. Under a customs union members substantially eliminate all tariff and nontariff barriers among themselves and establish a common external tariff for nonmembers.

An economic integration agreement liberalizes trade in services among members and covers a substantial number of sectors, affects a sufficient volume of trade, includes substantial modes of supply, and is nondiscriminatory (in the sense that similarly situated service suppliers are treated the same). Partial scope agreements are preferential trade agreements notified to the World Trade Organization (WTO) that are not a free trade agreement, a customs union, or an economic integration agreement. Unless otherwise indicated in the footnotes, information on the type of agreement and date of enforcement are based on the WTO's list of regional trade agreements.

Although bloc exports have been calculated back to 1990 on the basis of current membership, several blocs came into existence after that and membership may have changed over time. For this reason, and because systems of preferences also change over time, intratrade in earlier years may not have been affected by the same preferences as in recent years. In addition, some countries belong to more than one trade bloc, so shares of world exports exceed 100 percent. Exports of blocs include all commodity trade, which may include items not specified in trade bloc agreements. Differences from previously published estimates may be due to changes in membership or revisions in underlying data.

## Definitions

- **Merchandise exports within bloc** are the sum of merchandise exports by members of a trade bloc to other members of the bloc. They are shown both in U.S. dollars and as a percentage of total merchandise exports by the bloc.
- **Merchandise exports by bloc** as a share of world exports are the bloc's total merchandise exports (within the bloc and to the rest of the world) as a share of total merchandise exports by all economies in the world.

## The number of trade agreements has increased rapidly since 1990, especially free trade agreements

6.6a

**Note:** Data are the cumulative number of bilateral and multilateral trade agreements notified to the General Agreement on Tariffs and Trade/World Trade Organization at the time they entered into force. Agreements on accessions of new members to existing agreement are not included. Movements from one kind of agreement to another are taken into account.

**Source:** World Bank staff calculations based on World Trade Organization's Web portal on regional trade agreements.

## Data sources

Data on merchandise trade flows are published in the IMF's *Direction of Trade Statistics Yearbook* and *Direction of Trade Statistics Quarterly*; the data in the table were calculated using the IMF's Direction of Trade database. Data on trade bloc membership are from the World Bank Policy Research Report *Trade Blocs* (2000a), UNCTAD's *Trade and Development Report 2007*, WTO's Web portal on regional trade agreements, and the World Bank's International Trade Unit.

Note: Tariff rates include ad valorem equivalents of specific rates whenever available.

a. Rates are most favored nation rates. b. Excludes Eritrea. c. Refers to all member states of the European Union except Bulgaria and Romania. d. Includes Montenegro.

### About the data

Poor people in developing countries work primarily in agriculture and labor-intensive manufactures, sectors that confront the greatest trade barriers. Removing barriers to merchandise trade could increase growth in these countries—even more if trade in services (retailing, business, financial, and telecommunications services) were also liberalized.

In general, tariffs in high-income countries on imports from developing countries, though low, are twice those collected from other high-income countries. But protection is also an issue for developing countries, which maintain high tariffs on agricultural commodities, labor-intensive manufactures, and other products and services. In some developing regions new trade policies could make the difference between achieving important Millennium Development Goals—reducing poverty, lowering maternal and child mortality rates, improving educational attainment—and falling far short.

Countries use a combination of tariff and nontariff measures to regulate imports. The most common form of tariff is an ad valorem duty, based on the value of the import, but tariffs may also be levied on a specific, or per unit, basis or may combine ad valorem and specific rates. Tariffs may be used to raise fiscal revenues or to protect domestic industries from foreign competition—or both. Nontariff barriers, which limit the quantity of imports of a particular good, include quotas, prohibitions, licensing schemes, export restraint arrangements, and health and quarantine measures. Because of the difficulty of combining nontariff barriers into an aggregate indicator, they are not included in the table.

Unless specified as most favored nation rates, the tariff rates used in calculating the indicators in the table are effectively applied rates. Effectively applied rates are those in effect for partners in preferential trade arrangements such as the North American Free Trade Agreement. The difference between most favored nation and applied rates can be substantial. As more countries report their free trade agreements, suspensions of tariffs, or other special preferences, *World Development Indicators* will include their effectively applied rates. All estimates are calculated using the most recent information, which is not necessarily revised every year. As a result, data for the same year may differ from data in last year's edition.

Three measures of average tariffs are shown: simple bound rates and the simple and the weighted tariffs. Bound rates are based on all products in a country's tariff schedule, while the most favored

nation or applied rates are calculated using all traded items. Weighted mean tariffs are weighted by the value of the country's trade with each trading partner. Simple averages are often a better indicator of tariff protection than weighted averages, which are biased downward because higher tariffs discourage trade and reduce the weights applied to these tariffs. Bound rates result from trade negotiations incorporated into a country's schedule of concessions and are thus enforceable.

Some countries set fairly uniform tariff rates across all imports. Others are selective, setting high tariffs to protect favored domestic industries. The share of tariff lines with international peaks provides an indication of how selectively tariffs are applied. The effective rate of protection—the degree to which the value added in an industry is protected—may exceed the nominal rate if the tariff system systematically differentiates among imports of raw materials, intermediate products, and finished goods.

The share of tariff lines with specific rates shows the extent to which countries use tariffs based on physical quantities or other, non-ad valorem measures. Some countries such as Switzerland apply mainly specific duties. To the extent possible, these specific rates have been converted to their ad valorem equivalent rates and have been included in the calculation of simple and weighted tariffs.

Data are classified using the Harmonized System of trade at the six- or eight-digit level. Tariff line data were matched to Standard International Trade Classification (SITC) revision 1 codes to define commodity groups and import weights. Import weights were calculated using the United Nations Statistics Division's Commodity Trade (Comtrade) database. Data are shown only for the last year for which complete data are available.

### Definitions

- **Binding coverage** is the percentage of product lines with an agreed bound rate.
- **Simple mean bound rate** is the unweighted average of all the lines in the tariff schedule in which bound rates have been set.
- **Simple mean tariff** is the unweighted average of effectively applied rates or most favored nation rates for all products subject to tariffs calculated for all traded goods.
- **Weighted mean tariff** is the average of effectively applied rates or most favored nation rates weighted by the product import shares corresponding to each partner country.
- **Share of tariff lines with international peaks** is the share of lines in the tariff schedule with tariff rates that exceed 15 percent.
- **Share of tariff lines with specific rates** is the share of lines in the tariff schedule that are set on a per unit basis or that combine ad valorem and per unit rates.
- **Primary products** are commodities classified in SITC revision 2 sections 0–4 plus division 68 (nonferrous metals).
- **Manufactured products** are commodities classified in SITC revision 2 sections 5–8 excluding division 68.

### Data sources

All indicators in the table were calculated by World Bank staff using the World Integrated Trade Solution system. Data on tariffs were provided by the United Nations Conference on Trade and Development and the World Trade Organization. Data on global imports are from the United Nations Statistics Division's Comtrade database.

## About the data

A country's external indebtedness plays an important role in its creditworthiness and in perceptions by investors. Data on the external debt of developing countries are gathered by the World Bank through its Debtor Reporting System. Indebtedness is calculated using loan-by-loan reports submitted by countries on long-term public and publicly guaranteed borrowing, along with information on short-term debt collected by the countries or collected from creditors through the reporting systems of the Bank for International Settlements and the Organisation for Economic Co-operation and Development. These data are supplemented by information from major multilateral banks and official lending agencies in major creditor countries as well as estimates by World Bank and International Monetary Fund (IMF) staff. In addition, the table includes data on long-term private nonguaranteed debt that is either reported to the World Bank or estimated by its staff.

The coverage, quality, and timeliness of data vary across countries. Coverage varies for both debt instruments and borrowers. The widening spectrum of debt instruments and investors alongside the expansion of private nonguaranteed borrowing makes comprehensive coverage of external debt more complex. Reporting countries differ in their capacity to monitor debt, especially private nonguaranteed debt. Even data on public and publicly guaranteed debt are affected by coverage and accuracy in reporting—again because of monitoring capacity and sometimes because of an unwillingness to provide information. A key part often underreported is military debt.

Because debt data are normally reported in the currency of repayment, they have to be converted into

a single currency (U.S. dollars) to produce summary tables. Stock figures (amount of debt outstanding) are converted using end-of-period exchange rates, as published in the IMF's *International Financial Statistics* (line ae). Flow figures are converted at annual average exchange rates (line rf). Projected debt service is converted using end-of-period exchange rates. Debt repayable in multiple currencies, goods, or services and debt with a provision for maintenance of the value of the currency of repayment are shown at book value.

Because flow data are converted at annual average exchange rates and stock data at end-of-period exchange rates, year-to-year changes in debt outstanding and disbursed are sometimes not equal to net flows (disbursements less principal repayments); similarly, changes in debt outstanding, including undisbursed debt, differ from commitments less repayments. Discrepancies are particularly notable when exchange rates have moved sharply during the year. Cancellations and reschedulings of other liabilities into long-term public debt also contribute to the differences.

Variations in reporting rescheduled debt also affect cross-country comparability. For example, rescheduling under the auspices of the Paris Club of official creditors may be subject to lags between the completion of the general rescheduling agreement and the completion of the specific bilateral agreements that define the terms of the rescheduled debt. Other areas of inconsistency include country treatment of arrears and of nonresident national deposits denominated in foreign currency.

## Definitions

- **Total external debt** is debt owed to nonresidents repayable in foreign currency, goods, or services. It is the sum of public, publicly guaranteed, and private nonguaranteed long-term debt, short-term debt, and use of IMF credit.
- **Long-term debt** is debt that has an original or extended maturity of more than one year. It has three components: public, publicly guaranteed, and private nonguaranteed debt.
- **Public and publicly guaranteed debt** comprises the long-term external obligations of public debtors, including the national government and political subdivisions (or an agency of either) and autonomous public bodies, and the external obligations of private debtors that are guaranteed for repayment by a public entity.
- **IBRD loans and IDA credits** are extended by the World Bank. The International Bank for Reconstruction and Development (IBRD) lends at market rates. The International Development Association (IDA) provides credits at concessional rates.
- **Private nonguaranteed debt** consists of the long-term external obligations of private debtors that are not guaranteed for repayment by a public entity.
- **Short-term debt** is debt owed to nonresidents having an original maturity of one year or less and interest in arrears on long-term debt.
- **Use of IMF credit** denotes repurchase obligations to the IMF for all uses of IMF resources (excluding those resulting from drawings on the reserve tranche). These obligations, shown for the end of the year specified, comprise purchases outstanding under the credit tranches (including enlarged access resources) and all special facilities (the Buffer Stock, Compensatory and Contingency Financing, Extended Fund, Supplemental Reserve, Oil, Supplementary Financing, Policy on Enlarged Access, and Systemic Transformation), trust fund loans, and operations under the structural adjustment and poverty reduction and growth facilities.

## Financial integration has complemented growth

6.8a

For developing countries economic growth has exceeded debt accumulation since 1999.

Source: World Development Indicators data files.

## Data sources

Data on external debt are mainly reports to the World Bank through its Debtor Reporting System from member countries that have received IBRD loans or IDA credits, with additional information from the files of the World Bank, the IMF, the African Development Bank and African Development Fund, the Asian Development Bank and Asian Development Fund, and the Inter-American Development Bank. Summary tables of the external debt of developing countries are published annually in the World Bank's *Global Development Finance* and on its *Global Development Finance* CD-ROM.

a. Includes workers' remittances. b. The numerator refers to 2006, whereas the denominator is a three-year average of 2004–06 data. c. Data are from debt sustainability analyses undertaken as part of the Heavily Indebted Poor Countries Initiative. Present value estimates for these countries are for public and publicly guaranteed debt only. d. Includes Montenegro.

## About the data

A country's external debt burden, both debt outstanding and debt service, affects a country's creditworthiness and vulnerability. The table shows total external debt relative to a country's size—gross national income (GNI). Total debt service is contrasted with countries' ability to obtain foreign exchange through exports of goods, services, income, and workers' remittances. The ratios shown here may differ from those published elsewhere because estimates of exports and GNI have been revised to incorporate data available as of February 15, 2008.

Multilateral debt service (shown as a share of the country's total public and publicly guaranteed debt service) are obligations to international financial institutions, such as the World Bank, the International Monetary Fund (IMF), and regional development banks. Multilateral debt service takes priority over private and bilateral debt service, and borrowers must stay current with multilateral debts to remain creditworthy. While bilateral and private creditors often write off debts, international financial institution bylaws prohibit granting debt relief or canceling debts directly. However, the recent decrease in multilateral debt service ratios for some countries reflects debt relief from special programs, such as the Heavily Indebted Poor Countries (HIPC) Debt Initiative and the Multilateral Debt Relief Initiative (MDRI) (see table 1.4.) Other countries have accelerated repayment of debt outstanding. Indebted countries may also apply to the Paris and London Clubs to renegotiate obligations to public and private creditors.

Because short-term debt poses an immediate burden and is particularly important for monitoring

vulnerability, it is compared with the total debt and foreign exchange reserves that are instrumental in providing coverage for such obligations. The present value of external debt provides a measure of future debt service obligations.

The present value of external debt is calculated by discounting the debt service (interest plus amortization) due on long-term external debt over the life of existing loans. Short-term debt is included at face value. The data on debt are in U.S. dollars converted at official exchange rates (see *About the data* for table 6.8). The discount rate on long-term debt depends on the currency of repayment and is based on commercial interest reference rates established by the Organisation for Economic Co-operation and Development. Loans from the International Bank for Reconstruction and Development (IBRD), credits from the International Development Association (IDA), and obligations to the IMF are discounted using a special drawing rights reference rate. When the discount rate is greater than the loan interest rate, the present value is less than the nominal sum of future debt service obligations.

Debt ratios are used to assess the sustainability of a country's debt service obligations, but no absolute rules determine what values are too high. Empirical analysis of developing countries' experience and debt service performance shows that debt service difficulties become increasingly likely when the present value of debt reaches 200 percent of exports. Still, what constitutes a sustainable debt burden varies by country. Countries with fast-growing economies and exports are likely to be able to sustain higher debt levels.

## Definitions

- **Total external debt** is debt owed to nonresidents and comprises public, publicly guaranteed, and private nonguaranteed long-term debt, short-term debt, and use of IMF credit. It is presented as a share of gross national income (GNI).
- **Total debt service** is the sum of principal repayments and interest actually paid on total long-term debt (public and publicly guaranteed and private nonguaranteed), use of IMF credit, and interest on short-term debt.
- **Exports of goods, services, and income** refer to international transactions involving a change in ownership of general merchandise, goods sent for processing and repairs, nonmonetary gold, services, receipts of employee compensation for nonresident workers, investment income, and workers' remittances.
- **Multilateral debt service** is the repayment of principal and interest to the World Bank, regional development banks, and other multilateral and intergovernmental agencies.
- **Short-term debt** includes all debt having an original maturity of one year or less and interest in arrears on long-term debt.
- **Total reserves** comprise holdings of monetary gold, special drawing rights, reserves of IMF members held by the IMF, and holdings of foreign exchange under the control of monetary authorities.
- **Present value of debt** is the sum of short-term external debt plus the discounted sum of total debt service payments due on public, publicly guaranteed, and private nonguaranteed long-term external debt over the life of existing loans.

## Developing countries have reduced financial vulnerability

6.9a

Since 1990 developing countries have increased their buffer for external debt and its service. Total debt services have decreased significantly since 1999, due largely to debt relief initiatives by multilateral and bilateral donors.

Source: World Bank's *Global Development Finance*.

## Data sources

Data on external debt are mainly from reports to the World Bank through its Debtor Reporting System from member countries that have received IBRD loans or IDA credits, with additional information from the files of the World Bank, the IMF, the African Development Bank and African Development Fund, the Asian Development Bank and Asian Development Fund, and the Inter American Development Bank. Data on GNI, exports of goods and services, and total reserves are from the World Bank's national accounts files and the IMF's Balance of Payments and International Financial Statistics databases. Summary tables of the external debt of developing countries are published annually in the World Bank's *Global Development Finance* and on its *Global Development Finance* CD-ROM.

## About the data

Private financial flows account for the bulk of development finance and are split into two broad categories—equity and debt. Equity flows comprise foreign direct investment (FDI) and portfolio equity. Debt flows are financing raised through bond issuance, bank lending, and supplier credits.

The data on FDI and portfolio equity are based on balance of payments data reported by the International Monetary Fund (IMF). These data are supplemented by staff estimates using data from the United Nations Conference on Trade and Development and official national sources for FDI data and from market sources for portfolio equity data.

Under the internationally accepted definition of FDI, provided in the fifth edition of the IMF's *Balance of Payments Manual* (1993), FDI has three components: equity investment, reinvested earnings, and short- and long-term loans between parent firms and foreign affiliates. Distinguished from other kinds of international investment, FDI is made to establish a lasting interest in or effective management control over an enterprise in another country. As a guideline the IMF suggests that investments should account for at least 10 percent of voting stock to be counted as FDI. In practice many countries set a higher threshold. Also, many countries fail to report reinvested earnings, and the definition of long-term loans differs among countries.

FDI data do not give a complete picture of international investment in an economy. Balance of payments data on FDI do not include capital raised locally, which has become an important source of financing for investment projects in some developing

countries. In addition, FDI data capture only cross-border investment flows involving equity participation and thus omit nonequity crossborder transactions such as intrafirm flows of goods and services. For a detailed discussion of the data issues, see the World Bank's *World Debt Tables 1993–94* (vol. 1, chap. 3).

Statistics on bonds, bank lending, and supplier credits are produced by aggregating individual transactions of public and publicly guaranteed debt and private nonguaranteed debt. Data on public and publicly guaranteed debt are reported through the Debtor Reporting System by World Bank member economies that have received either loans from the International Bank for Reconstruction and Development or credits from the International Development Association. These reports are cross-checked with data reported from market sources that also provide transactional data. Information on private nonguaranteed bonds and bank lending is collected from market sources, because official national sources reporting to the Debtor Reporting System are not asked to report the breakdown between private nonguaranteed bonds and private nonguaranteed loans.

The volume of global private financial flows reported by the World Bank generally differs from that reported by other sources because of differences in sources, classification of economies, and method used to adjust and disaggregate reported information. In addition, particularly for debt financing, differences may also result based on whether particular installments of the transactions are included and how certain offshore issuances are treated.

## Definitions

- **Foreign direct investment** is net inflows of investment to acquire a lasting interest in or management control over an enterprise operating in an economy other than that of the investor. It is the sum of equity capital, reinvestment of earnings, other long-term capital, and short-term capital, as shown in the balance of payments.
- **Portfolio equity** includes net inflows from equity securities other than those recorded as direct investment and including shares, stocks, depository receipts and direct purchases of shares in local stock markets by foreign investors
- **Bonds** are securities issued with a fixed rate of interest for a period of more than one year. They include net flows through cross-border public and publicly guaranteed and private nonguaranteed bond issues.
- **Commercial bank and other lending** includes net commercial bank lending (public and publicly guaranteed and private nonguaranteed) and other private credits.

## Financial integration of low-income economies remains marginal

6.10a

Since 2002 net private financial flows to developing countries have risen sharply, driven by increased foreign direct investment. However, financial integration of low-income economies remains marginal.

**Note:** Net private financial flows are the sum of net flows of foreign direct investment, portfolio equity, bonds, and commercial bank and other lending.

Source: World Bank Debtor Reporting System.

## Data sources

Data on equity and debt flows are compiled from a variety of public and private sources, including the World Bank's Debtor Reporting System, the IMF's *International Financial Statistics* and Balance of Payments databases, and Dealogic. These data are also published in the World Bank's *Global Development Finance 2008*.

a. Aggregates include amounts for economies not specified elsewhere. b. World and income group aggregates include flows not allocated by country or region.

## About the data

The table shows financing from official bilateral and multilateral sources. It shows concessional and nonconcessional financial flows from the major multilateral institutions—the World Bank, the International Monetary Fund (IMF), regional development banks, other international financial institutions, and UN agencies.

The multilateral development banks fund their non-concessional lending operations primarily by selling low-interest, highly rated bonds backed by prudent lending and financial policies and the strong financial support of their members. Funds are then on-lent at slightly higher interest rates with 15- to 20-year maturities to developing countries. Lending terms vary with market conditions and bank policies.

Concessional flows from multilateral development banks are credits provided through their concessional lending facilities. The cost of these loans is reduced through subsidies from donors or other resources. Grants from multilateral agencies are not included in the net flows. Concessional flows from bilateral donors are defined by the Organisation for Economic Co-operation and Development's (OECD) Development Assistance Committee (DAC) as financial flows with a grant element of at least 25 percent. The grant element is evaluated assuming a 10 percent nominal discount rate. The grant element is nil for a loan with a 10 percent interest rate and 100 percent for a grant, which requires no repayment.

All World Bank concessional lending is carried out by the International Development Association (IDA). Eligibility for IDA resources is based on gross national

income (GNI) per capita and performance standards assessed by World Bank staff. The cutoff for IDA eligibility is set at the beginning of the World Bank's fiscal year. Since July 1, 2007, the GNI per capita cutoff has been \$1,065, measured in 2006 U.S. dollars using the *World Bank Atlas* method (see *Users guide*). In exceptional circumstances IDA extends temporary eligibility to countries above the cutoff and that are undertaking major adjustment efforts but are not creditworthy for International Bank for Reconstruction and Development (IBRD) lending. Exceptions are also made for small island economies. The IBRD lends to creditworthy countries at an initial interest rate that consists of a variable base rate of six-month LIBOR, and a spread, either variable or fixed, for the life of the loan. The lending rate is reset every six months on the interest payment dates for the loan and applies to the interest period beginning on that date. Although some outstanding IBRD loans have a low enough interest rate to be classified as concessional under the DAC definition, all IBRD loans in the table are classified as nonconcessional. Lending by the International Finance Corporation is not included in the table.

The IMF makes concessional funds available through its Poverty Reduction and Growth Facility and the IMF Trust Fund. Eligibility is based principally on a country's per capita income and eligibility under IDA.

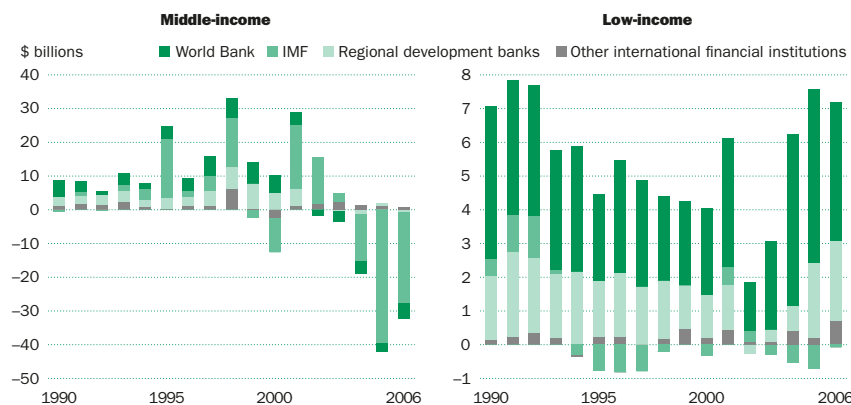

Regional development banks also maintain concessional windows. Loans from the major regional development banks are recorded in the table according to each institution's classification and not according to the DAC definition.

## Definitions

- **Total net official financial flows** are disbursements of public or publicly guaranteed loans and credits, less repayments of principal.
- **IDA** is the International Development Association, the concessional loan window of the World Bank Group.
- **IBRD** is the International Bank for Reconstruction and Development, the founding and largest member of the World Bank Group.
- **IMF** is the International Monetary Fund, which provides concessional lending through the Poverty Reduction and Growth Facility and the IMF Trust Fund and nonconcessional lending through the credit it provides to its members, mainly to meet balance of payments needs.
- **Regional development banks** are the African Development Bank, in Tunis, Tunisia, which serves all of Africa, including North Africa; the Asian Development Bank, in Manila, Philippines, which serves South and Central Asia and East Asia and Pacific; the European Bank for Reconstruction and Development, in London, United Kingdom, which serves Europe and Central Asia; and the Inter-American Development Bank, in Washington, D.C., which serves the Americas.
- **Concessional financial flows** are disbursements made through concessional lending facilities.
- **Nonconcessional financial flows** are all disbursements that are not concessional.
- **Other institutions** is a residual category in the World Bank's Debtor Reporting System that includes other multilateral institutions such as the Caribbean Development Fund, Council of Europe, European Development Fund, Islamic Development Bank, Nordic Development Fund, and the like.
- **United Nations** includes the United Nations Children's Fund (UNICEF), United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), World Food Programme (WFP), and other UN agencies, such as the International Fund for Agricultural Development, United Nations Development Programme, United Nations Population Fund, United Nations Refugee Agency, and United Nations Regular Programme for Technical Assistance.

### While net financial flows to middle-income economies are falling, low-income economies are still borrowing from international financial institutions

6.11a

In recent years, as many middle-income economies paid off loans from international financial institutions, net disbursement fell sharply. But international financial institutions still maintain a positive flow of net disbursement to low-income economies.

Source: World Bank Debtor Reporting System.

## Data sources

Data on net financial flows from international financial institutions are from the World Bank's Debtor Reporting System and published in the World Bank's *Global Development Finance 2008* and electronically as *GDF Online*. Data on aid from UN agencies are from the DAC annual *Development Cooperation Report* and are available electronically on the OECD's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline).

## About the data

The flows of official and private financial resources from the members of the Development Assistance Committee (DAC) of the Organisation for Economic Co-operation and Development (OECD) to developing economies are compiled by DAC, based principally on reporting by DAC members using standard questionnaires issued by the DAC Secretariat.

The table shows data reported by DAC member economies and does not include aid provided by the Commission of the European Communities—a multilateral member of DAC.

DAC exists to help its members coordinate their development assistance and to encourage the expansion and improve the effectiveness of the aggregate resources flowing to recipient economies. In this capacity DAC monitors the flow of all financial resources, but its main concern is official development assistance (ODA). Grants or loans to countries and territories on the DAC list of aid recipients have to meet three criteria to be counted as ODA. They are undertaken by the official sector. They promote economic development and welfare as the main objective. And they are provided at concessional financial terms (loans must have a grant element of at least 25 percent, calculated at a discount rate of 10 percent). The DAC Statistical Reporting Directives provide the most detailed explanation of this definition and all ODA-related rules.

This definition excludes nonconcessional flows from official creditors, which are classified as “other official flows,” and aid for military purposes. Transfer payments to private individuals, such as pensions, reparations, and insurance payouts, are in general not counted. In addition to financial flows, technical cooperation is included in ODA. Most expenditures for peacekeeping under UN mandates and assistance to refugees are counted in ODA. Also included are contributions to multilateral institutions, such as the United Nations and its specialized agencies, and concessional funding to multilateral development banks.

DAC has revised the list of countries and territories that are counted as aid recipients. These revisions will govern aid reporting for three years, starting with 2005 flows. In the past DAC distinguished aid going to Part I and Part II countries. Part I countries, the recipients of ODA, comprised many of the countries classified by the World Bank as low- and middle-income economies. Part II countries, whose assistance was designated official aid, included the more advanced countries of Central and Eastern Europe, countries of the former Soviet Union, and certain

advanced developing countries and territories. This distinction has been dropped. ODA recipients now comprise all low- and middle-income countries except those that are members of the Group of Eight or the European Union (including countries with a firm date for EU accession). The content and structure of tables 6.12 through 6.15 have been revised to reflect this change. Because official aid flows are quite small relative to ODA, the net effect of these changes is believed to be minor.

Flows are transfers of resources, either in cash or in the form of commodities or services measured on a cash basis. Short-term capital transactions (with one year or less maturity) are not counted. Repayments of the principal (but not interest) of ODA loans are recorded as negative flows. Proceeds from official equity investments in a developing country are reported as ODA, while proceeds from their later sale are recorded as negative flows.

Because the table is based on donor country reports, it does not provide a complete picture of the resources received by developing economies for two reasons. First, flows from DAC members are only part of the aggregate resource flows to these economies. Second, the data that record contributions to multilateral institutions measure the flow of resources made available to those institutions by DAC members, not the flow of resources from those institutions to developing and transition economies.

Aid as a share of gross national income (GNI), aid per capita, and ODA as a share of the general government disbursements of the donor are calculated by the OECD. The denominators used in calculating these ratios may differ from corresponding values elsewhere in this book because of differences in timing or definitions.

## Definitions

- **Net disbursements** are gross disbursements of grants and loans minus repayments of principal on earlier loans.
- **Total net flows** comprise ODA or official aid flows, other official flows, private flows, and net grants by nongovernmental organizations.
- **Official development assistance** comprises flows that meet the DAC definition of ODA and are made to countries and territories on the DAC list of aid recipients.
- **Bilateral grants** are transfers of money or in kind for which no repayment is required.
- **Bilateral loans** are loans extended by governments or official agencies that have a grant element of at least 25 percent (calculated at a 10 percent discount rate).
- **Contributions to multilateral institutions**

are concessional funding received by multilateral institutions from DAC members as grants or capital subscriptions.

- **Other official flows** are transactions by the official sector whose main objective is other than development or whose grant element is less than 25 percent.
- **Private flows** are flows at market terms financed from private sector resources in donor countries. They include changes in holdings of private long-term assets by reporting country residents.
- **Foreign direct investment** is investment by residents of DAC member countries to acquire a lasting management interest (at least 10 percent of voting stock) in an enterprise operating in the recipient country. The data reflect changes in the net worth of subsidiaries in recipient countries whose parent company is in the DAC source country.
- **Bilateral portfolio investment** covers bank lending and the purchase of bonds, shares, and real estate by residents of DAC member countries in recipient countries.
- **Multilateral portfolio investment** are transactions of private banks and nonbanks in DAC member countries in the securities issued by multilateral institutions.
- **Private export credits** are loans extended to recipient countries by the private sector in DAC member countries to promote trade; they may be supported by an official guarantee.
- **Net grants by nongovernmental organizations (NGOs)** are private grants by NGOs, net of subsidies from the official sector.
- **Commitments** are obligations, expressed in writing and backed by funds, undertaken by an official donor to provide specified assistance to a recipient country or multilateral organization.
- **Gross disbursements** are the international transfer of financial resources and goods and services, valued at the cost to the donor.

## Data sources

Data on financial flows are compiled by OECD-DAC and published in its annual statistical report, *Geographical Distribution of Financial Flows to Aid Recipients*, and its annual *Development Cooperation Report*. Data are available electronically on the OECD's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline).

a. At current exchange rates and prices. b. Includes aid for promoting development awareness and aid provided to refugees in donor economies.

## About the data

Aid can be used in many ways. The sector to which aid goes, the form it takes, and the procurement restrictions attached to it are important influences on aid effectiveness. The data on allocation of official development assistance (ODA) in the table are based principally on reporting by members of the Organisation for Economic Co-operation and Development (OECD) Development Assistance Committee (DAC). For more detailed explanation of ODA, see *About the data* for table 6.12.

The form in which an ODA contribution reaches the benefiting sector or the economy is important. A distinction is made between resource provision and technical cooperation. Resource provision involves mainly cash or in-kind transfers and financing of capital projects, with the deliverables being financial support and the provision of commodities and supplies. Technical cooperation includes grants to nationals of aid-recipient countries receiving education or training at home or abroad, and payments to consultants, advisers, and similar personnel and to teachers and administrators serving in recipient countries. Technical cooperation is spent mostly in the donor economy.

Two other types of aid are presented because they serve distinctive purposes. Debt-related aid aims to

provide debt relief on liabilities that recipient countries have difficulty servicing. Thus, this type of aid may not provide a full value of new resource flows for development, in particular for heavily indebted poor countries. Humanitarian assistance provides relief following sudden disasters and supports food programs in emergency situations. This type of aid does not generally contribute to financing long-term development.

## Definitions

• **Net disbursements** are gross disbursements of grants and loans minus repayments of principal on earlier loans • **Development projects, programs, and other resource provisions** are aid provided as cash transfers, aid in kind, development food aid, and the financing of capital projects, intended to increase or improve the recipient's stock of physical capital and to support recipient's development plans and other activities with finance and commodity supply. • **Technical cooperation** is the provision of resources whose main aim is to augment the stock of human intellectual capital, such as the level of knowledge, skills, and technical know-how in the recipient country (including the cost of associated equipment). Contributions take the form mainly of the supply of

human resources from donors or action directed to human resources (such as training or advice). Also included are aid for promoting development awareness and aid provided to refugees in the donor economy. Assistance specifically to facilitate a capital project is not included. • **Debt-related aid** groups all actions relating to debt, including forgiveness, swaps, buybacks, rescheduling, and refinancing. • **Humanitarian assistance** is emergency and distress relief (including aid to refugees and assistance for disaster preparedness). • **Administrative costs** are the total current budget outlays of institutions responsible for the formulation and implementation of donor's aid programs and other administrative costs incurred by donors in aid delivery.

## Data sources

Data on aid flows are published by OECD-DAC in its annual statistical report, *Geographical Distribution of Financial Flows to Aid Recipients*, and its annual *Development Cooperation Report*. Data are available electronically on the OECD's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline).

a. Excludes technical cooperation and administrative costs.

### About the data

The Development Assistance Committee (DAC) records the sector classification of aid using a three-level hierarchy. The top level is grouped by themes, such as social infrastructure and services; economic infrastructure, services, and production; and multisector or cross-cutting areas. The second level is more specific. Education and health and transport and storage are examples. The third level comprises subsectors such as basic education and basic health. Some contributions are reported as non-sector-allocable aid.

Reporting on the sectoral destination and the form of aid by donors may not be complete. Also, measures of aid allocation may differ from the perspectives of donors and recipients because of difference in classification, available information, and recording time.

The proportion of untied aid is reported because tying arrangements may prevent recipients from obtaining the best value for their money. Tying requires recipients to purchase goods and services from the donor country or from a specified group of countries. Such arrangements prevent a recipient from misappropriating or mismanaging aid receipts, but they may also be motivated by a desire to benefit donor country suppliers.

### Definitions

- **Bilateral official development assistance (ODA) commitments** are firm obligations, expressed in writing and backed by the necessary funds, undertaken by official bilateral donors to provide specified assistance to a recipient country or a multilateral organization. Bilateral commitments are recorded in the full amount of expected transfer, irrespective of the time required for completing disbursements.
- **Total sector-allocable aid** is the sum of aid that can be assigned to specific sectors or multisector activities.
- **Social infrastructure and services** refer to efforts to develop the human resources potential of aid recipients.
- **Education** includes general teaching and instruction at all levels, as well as construction to improve or adapt educational establishments. Training in a particular field is reported for the sector concerned.
- **Health** covers assistance to hospitals, clinics, other medical and dental services, public health administration, and medical insurance programs.
- **Population** covers all activities related to family planning and research into population problems.
- **Water supply and sanitation** cover assistance for water supply and use, sanitation, and water resources development (including rivers).
- **Government and civil society** include assistance to strengthen government administrative apparatus

and planning and activities promoting good governance and civil society.

- **Economic infrastructure, services, and production sector** group assistance for networks, utilities, services that facilitate economic activity, and contributions to all directly productive sectors.
- **Transport and communication** cover road, rail, water, and air transport; post and telecommunications; and radio, television, and print media.
- **Agriculture** includes sector policy, development, and inputs; crop and livestock production; and agricultural credit, cooperatives, and research.
- **Multisector or cross-cutting** includes support for projects that straddle several sectors.
- **Untied aid** is ODA not subject to restrictions by donors on procurement sources.

### Data sources

Data on aid flows are published annually by the Organisation for Economic Co-operation and Development (OECD) DAC in *Geographical Distribution of Financial Flows to Aid Recipients and Development Cooperation Report*. Data are available electronically on the OECD's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline).

**Note:** Regional aggregates include data for economies not listed in the table. World and income group totals include aid not allocated by country or region—including administrative costs, research on development issues, and aid to nongovernmental organizations. Thus regional and income group totals do not sum to the world total.

a. The distinction between official aid, for countries on the Part II list of the Organisation for Economic Co-operation and Development Assistance Committee (DAC), and official development assistance was dropped in 2005. b. No longer on the DAC list of eligible official development assistance recipients. Data for 2000 are official aid. c. Includes Montenegro.

### About the data

Unless otherwise noted, aid includes official development assistance (ODA; see *About the data* for table 6.12). The data cover loans and grants from Development Assistance Committee (DAC) member countries, multilateral organizations, and non-DAC donors. They do not reflect aid given by recipient countries to other developing countries. As a result, some countries that are net donors (such as Saudi Arabia) are shown in the table as aid recipients (see table 6.14a). Data before 2005 for countries that were Part II recipients (see *About the data* for table 6.12 for more information) are defined as official aid.

The table does not distinguish types of aid (program, project, or food aid; emergency assistance; postconflict peacekeeping assistance; or technical cooperation), which may have different effects on the economy. Expenditures on technical cooperation do not always directly benefit the economy to the extent that they defray costs incurred outside the country on salaries and benefits of technical experts and overhead costs of firms supplying technical services.

Ratios of aid to gross national income (GNI), gross capital formation, imports, and government spending provide measures of recipient country dependency on aid. But care must be taken in drawing policy conclusions. For foreign policy reasons some countries have traditionally received large amounts of aid. Thus aid dependency ratios may reveal as much about a donor's interest as about a recipient's needs. Ratios are generally much higher in Sub-Saharan Africa than in other regions, and they increased in the 1980s. High ratios are due only in part to aid flows. Many African countries saw severe erosion in their terms of trade in the 1980s, which, along with weak policies, contributed to falling incomes, imports, and investment. Thus the increase in aid dependency ratios reflects events affecting both the numerator (aid) and the denominator (GNI).

Because the table relies on information from donors, it is not necessarily consistent with information recorded by recipients in the balance of payments, which often excludes all or some technical assistance—particularly payments to expatriates

made directly by the donor. Similarly, grant commodity aid may not always be recorded in trade data or in the balance of payments. Moreover, DAC statistics exclude purely military aid.

The nominal values used here may overstate the real value of aid to recipients. Changes in international prices and exchange rates can reduce the purchasing power of aid. Tying aid, still prevalent though declining in importance, also tends to reduce its purchasing power (see *About the data* for table 6.13).

The aggregates refer to World Bank definitions. Therefore the ratios shown may differ from those of the Organisation for Economic Co-operation and Development (OECD).

### Definitions

- **Net official development assistance** is flows (net of repayment of principal) that meet the DAC definition of ODA and are made to countries and territories on the DAC list of aid recipients. See *About the data* for table 6.12.
- **Aid per capita** is ODA divided by midyear population.
- **Aid dependency ratios** are calculated using values in U.S. dollars converted at official exchange rates. Imports of goods, services, and income refer to international transactions involving a change in ownership of general merchandise, goods sent for processing and repairs, nonmonetary gold, services, receipts of employee compensation for nonresident workers, and investment income. For definitions of GNI, gross capital formation, and central government expense, see *Definitions* for tables 1.1, 4.8, and 4.10.

### Official development assistance from non-DAC donors, 2002–06

**Note:** The table does not reflect aid provided by several major emerging non–Organisation for Economic Co-operation and Development donors because information on their aid has not been disclosed.

a. Includes \$87.8 million in 2002, \$68.8 million in 2003, \$47.9 million in 2004, \$49.2 million in 2005, and \$45.5 million in 2006 for first-year sustenance expenses for people arriving from developing countries (many of which are experiencing civil war or severe unrest) or people who have left their country for humanitarian or political reasons.

Source: Organisation for Economic Co-operation and Development.

### Data sources

Data on financial flows are compiled by DAC and published in its annual statistical report, *Geographical Distribution of Financial Flows to Aid Recipients*, and in its annual *Development Cooperation Report*. Data are available electronically on the OECD's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline). Data on population, GNI, gross capital formation, imports of goods and services, and central government expense used in computing the ratios are from World Bank and International Monetary Fund databases.

Note: Regional aggregates include data for economies not specified elsewhere. World and income group totals include aid not allocated by country or region.

## About the data

The table shows net bilateral aid to low- and middle-income economies from members of the Development Assistance Committee (DAC) of the Organisation for Economic Co-operation and Development (OECD). The data include aid to some countries and territories not shown in the table and aid to unspecified economies recorded only at the regional or global level. Aid to countries and territories not shown in the table has been assigned to regional totals based on the World Bank's regional classification system. Aid to unspecified economies is included in regional totals and, when possible, income group totals. Aid not allocated by country or region—including administrative costs, research on development, and aid to nongovernmental organizations—is included in the world total. Thus regional and income group totals do not sum to the world total.

The table is based on donor country reports of bilateral programs, which may differ from reports by recipient countries. Recipients may lack access to

information on such aid expenditures as development-oriented research, stipends and tuition costs for aid-financed students in donor countries, and payment of experts hired by donor countries. Moreover, a full accounting would include donor country contributions to multilateral institutions, the flow of resources from multilateral institutions to recipient countries, and flows from countries that are not members of DAC. Previous editions of the table included only DAC member economies. This year's edition includes net aid from the European Commission—a multilateral member of DAC.

The expenditures that countries report as official development assistance (ODA) have changed. For example, some DAC members have reported as ODA the aid provided to refugees during the first 12 months of their stay within the donor's borders.

Some of the aid recipients shown in the table are also aid donors. See table 6.14a for a summary of ODA from non-DAC countries.

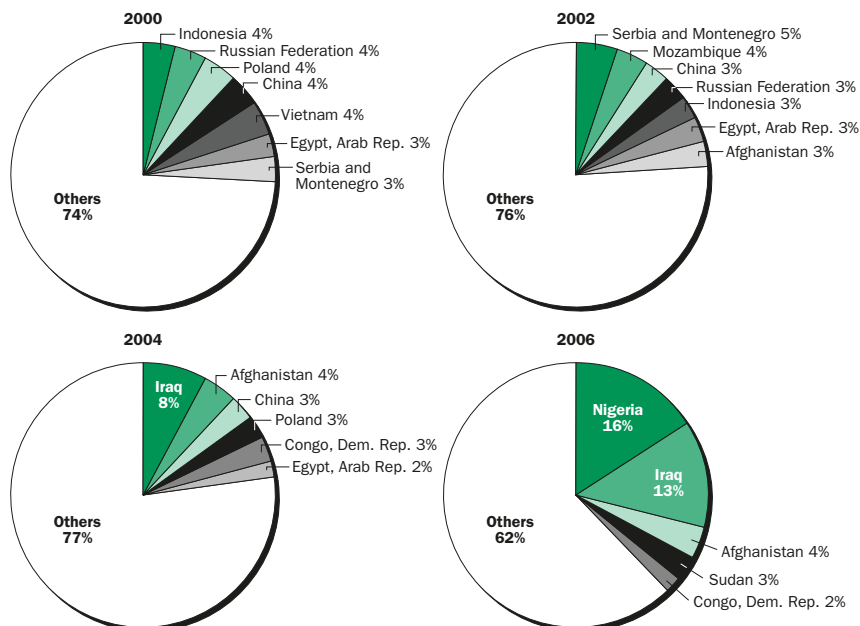

## Definitions

• **Net aid** comprises net bilateral official development assistance that meets the DAC definition of official development assistance and are made to countries and territories on the DAC list of aid recipients. See *About the data* for table 6.12 • **Other DAC donors** are Australia, Austria, Belgium, Denmark, Finland, Greece, Ireland, Italy, Luxembourg, New Zealand, Portugal, Spain, and Switzerland.

## Debt relief and political interests have shaped the allocation of official development assistance

### 6.15a

Share of official development assistance (ODA) net disbursements received

One-time disbursements of debt relief to Iraq and Nigeria increased their share of ODA in 2006. Large aid flows also went to fragile states and international hot spots. Some changes reflect administrative decisions: since 2005 aid to the Russian Federation and the new member states of the European Union are no longer counted as ODA.

**Note:** Only ODA allocated to specific economies are included in the denominators.

**Source:** Organisation for Economic Co-operation and Development Development Assistance Committee.

## Data sources

Data on financial flows are compiled by DAC and published in its annual statistical report, *Geographical Distribution of Financial Flows to Aid Recipients*, and its annual *Development Cooperation Report*. Data are available electronically on the OECD's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline).

a. World Bank estimates. b. Includes Palestinian refugees under the mandate of the United Nations Relief and Works Agency for Palestine Refugees in the Near East, who are not included in data from the UN Refugee Agency (UNHCR). c. Includes Montenegro. d. World totals computed by the United Nations sum to zero, but because the aggregates refer to World Bank definitions, regional and income group totals do not. e. Includes refugees without specified country of origin. f. Regional and income group totals do not sum to the world total because of rounding.

### About the data

Movement of people, most often through migration, is a significant part of global integration. Migrants contribute to the economies of both their host country and their country of origin. Yet reliable statistics on migration are difficult to collect and are often incomplete, making international comparisons a challenge.

The United Nations Population Division provides data on net migration and migration stock. To derive estimates of net migration, the organization takes into account the past migration history of a country or area, the migration policy of a country, and the influx of refugees in recent periods. The data to calculate these official estimates come from a variety of sources, including border statistics, administrative records, surveys, and censuses. When no official estimates can be made because of insufficient data, net migration is derived through the balance equation, which is the difference between overall population growth and the natural increase during the 1990–2000 intercensal period.

The data used to estimate the international migrant stock at a particular time are obtained mainly from population censuses. The estimates are derived from the data on foreign-born population—people who have residence in one country but were born in another country. When data on the foreign-born population are not available, data on foreign population—that is, people who are citizens of a country other than the country in which they reside—are used as estimates.

After the breakup of the Soviet Union in 1991 people living in one of the newly independent countries who were born in another were classified as international migrants. Estimates of migration stock in the newly independent states from 1990 on are based on the 1989 census of the Soviet Union.

For countries with information on the international migrant stock for at least two points in time, interpolation or extrapolation was used to estimate the international migrant stock on July 1 of the reference years. For countries with only one observation, estimates for the reference years were derived using rates of change in the migrant stock in the years preceding or following the single observation available. A model was used to estimate migration for countries that had no data.

Registrations, together with other sources—including estimates and surveys—are the main sources of refugee data. But there are difficulties in collecting accurate statistics. Although refugees are often registered individually, the accuracy of

registrations varies greatly. Many refugees may not be aware of the need to register or may choose not to do so. And administrative records tend to overestimate the number of refugees because it is easier to register than to de-register. The UN Refugee Agency (UNHCR) collects and maintains data on refugees, except for Palestinian refugees residing in areas under the mandate of the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA). The UNRWA provides services to Palestinian refugees who live in certain areas and who register with the agency. Registration is voluntary, and estimates by the UNRWA are not an accurate count of the Palestinian refugee population. The table shows estimates of refugees collected by the UNHCR, complemented by estimates of Palestinian refugees under the UNRWA mandate. Thus, the aggregates differ from those published by the UNHCR.

Workers' remittances and compensation of employees are World Bank staff estimates based on data from the International Monetary Fund's (IMF) *Balance of Payments Yearbook*. The IMF data are supplemented by World Bank staff estimates for missing data for countries where workers' remittances are important. The data reported here are the sum of three items defined in the IMF's *Balance of Payments Manual* (fifth edition): workers' remittances, compensation of employees, and migrants' transfers.

The distinction between these three items is not always consistent in the data reported by countries to the IMF. In some cases countries compile data on the basis of the citizenship of migrant workers rather than their residency status. Some countries also report remittances entirely as workers' remittances or compensation of employees. Following the fifth edition of the *Balance of Payments Manual* in 1993, migrants' transfers are considered a capital transaction, but previous editions regarded them as current transfers. For these reasons the figures presented in the table take all three items into account.

### Definitions

- **Net migration** is the net total of migrants during the period. It is the total number of immigrants less the total number of emigrants, including both citizens and noncitizens. Data are five-year estimates.
- **International migrant stock** is the number of people born in a country other than that in which they live. It includes refugees.
- **Refugees** are people who are recognized as refugees under the 1951 Convention Relating to the Status of Refugees or its 1967 Protocol, the 1969 Organization of African Unity Convention Governing the Specific Aspects of Refugee Problems in Africa, people recognized as refugees in accordance with the UNHCR statute, people granted refugee-like humanitarian status, and people provided temporary protection. Asylum seekers are people who have applied for asylum or refugee status and who have not yet received a decision or who are registered as asylum seekers. Palestinian refugees are people (and their descendants) whose residence was Palestine between June 1946 and May 1948 and who lost their homes and means of livelihood as a result of the 1948 Arab-Israeli conflict.
- **Country of origin** refers to the nationality or country of citizenship of a claimant.
- **Country of asylum** is the country where an asylum claim was filed.
- **Workers' remittances and compensation of employees** received and paid comprise current transfers by migrant workers and wages and salaries earned by nonresident workers. Remittances are classified as current private transfers from migrant workers resident in the host country for more than a year, irrespective of their immigration status, to recipients in their country of origin. Migrants' transfers are defined as the net worth of migrants who are expected to remain in the host country for more than one year that is transferred to another country at the time of migration. Compensation of employees is the income of migrants who have lived in the host country for less than a year.

### Data sources

Data on net migration are from the United Nations Population Division's *World Population Prospects: The 2006 Revision*. Data on migration stock come from the United Nations Population Division's *Trends in Total Migrant Stock: The 2005 Revision*. Data on refugees are from the UNHCR's *Statistical Yearbook 2006*, complemented by statistics on Palestinian refugees under the mandate of the UNRWA as published on its website. Data on remittances are World Bank staff estimates based on IMF balance of payments data.

a. Arrivals in hotels only. b. Arrivals of nonresident visitors at national borders. c. Includes nationals residing abroad. d. Country estimates. e. Arrivals by air only. f. Arrivals in all types of accommodation establishments. g. Arrivals in hotels and similar establishments. h. Expenditure on travel-related items only; excludes passenger transport items. i. Excludes nationals residing abroad.

## About the data

Tourism is defined as the activities of people traveling to and staying in places outside their usual environment for no more than one year for leisure, business, and other purposes not related to an activity remunerated from within the place visited. The social and economic phenomenon of tourism has grown substantially over the past quarter century.

Statistical information on tourism is based mainly on data on arrivals and overnight stays along with balance of payments information. But these data do not completely capture the economic phenomenon of tourism or give governments, businesses, and citizens the information needed for effective public policies and efficient business operations. Credible data are needed on the scale and significance of tourism. Information on the role of tourism in national economies is particularly deficient. Although the World Tourism Organization reports that progress has been made in harmonizing definitions and measurement, differences in national practices still prevent full international comparability.

The data in the table are from the World Tourism Organization, an agency of the United Nations. The data on international inbound and outbound tourists refer to the number of arrivals and departures of visitors, not to the number of people traveling. Thus a person who makes several trips to a country during a given period is counted each time as a new arrival. Unless otherwise indicated in the footnotes, the data on inbound tourism show the arrivals of nonresident tourists (overnight visitors) at national borders. When data on international tourists are unavailable or incomplete, the table shows

the arrivals of international visitors, which include tourists, same-day visitors, cruise passengers, and crew members.

Sources and collection methods for data on arrivals differ across countries. In some cases data are obtained from border statistics (police, immigration, and the like) and supplemented by border surveys. In other cases data are obtained from tourism accommodation establishments. For some countries number of arrivals is limited to arrivals by air and for others to arrivals staying in hotels. Some countries include arrivals of nationals residing abroad while others do not. Comparison of arrivals across countries should thus be treated with caution.

The World Tourism Organization is improving its coverage of tourism expenditure data. It is now using balance of payments data from the International Monetary Fund (IMF), supplemented by data received from individual countries. The new data, shown in the table, include travel and passenger transport items as defined in the IMF's *Balance of Payments Manual*. When the IMF does not report data on passenger transport items, expenditure data for travel items are shown instead.

Aggregates are based on the World Bank's classification of countries and differ from those of the World Tourism Organization. Countries not shown in the table but for which data are available are included in the regional and income group totals. The aggregates are calculated using the World Bank's weighted aggregation methodology (see *Statistical methods*) and differ from the World Tourism Organization's aggregates.

## Definitions

• **International inbound tourists** (overnight visitors) are the number of tourists who travel to a country other than that in which they have their usual residence, but outside their usual environment, for a period not exceeding 12 months and whose main purpose in visiting is other than an activity remunerated from within the country visited. When data on number of tourists are not available, the number of visitors, which includes tourists, same-day visitors, cruise passengers, and crew members, is shown instead. • **International outbound tourists** are the number of departures that people make from their country of usual residence to any other country for any purpose other than a remunerated activity in the country visited. • **Inbound tourism expenditure** is expenditures by international inbound visitors, including payments to national carriers for international transport. These receipts include any other prepayment made for goods or services received in the destination country. They also may include receipts from same-day visitors, except when these are important enough to justify separate classification. For some countries they do not include receipts for passenger transport items. Their share in exports is calculated as a ratio to exports of goods and services, which comprise all transactions between residents of a country and the rest of the world involving a change of ownership from residents to nonresidents of general merchandise, goods sent for processing and repairs, nonmonetary gold, and services. • **Outbound tourism expenditure** is expenditures of international outbound visitors in other countries, including payments to foreign carriers for international transport. These expenditures may include those by residents traveling abroad as same-day visitors, except in cases where these are important enough to justify separate classification. For some countries they do not include expenditures for passenger transport items. Their share in imports is calculated as a ratio to imports of goods and services, which comprise all transactions between residents of a country and the rest of the world involving a change of ownership from nonresidents to residents of general merchandise, goods sent for processing and repairs, nonmonetary gold, and services.

## Developing countries are spending more on tourism in other countries

6.17a

Although almost 80 percent of the world's expenditure on tourism in other countries originated in high-income countries in 2006, developing countries' share has been gradually rising. Developing countries' expenditures on tourism in other countries nearly doubled between 2000 and 2006.

Source: World Bank staff calculations based on World Tourism Organization data.

## Data sources

Data on visitors and tourism expenditure are from the World Tourism Organization's *Yearbook of Tourism Statistics* and *Compendium of Tourism Statistics 2008*. Data in the table are updated from electronic files provided by the World Tourism Organization. Data on exports and imports are from the IMF's *Balance of Payments Statistics Yearbook* and data files.
